Reliability of Computer Communication Networks with Delay, Traffic and Routing Fathi Ahmed Ben Shatwan, 1983 *Reliability of Computer and Communication Networks* Fred S. Roberts, Frank Hwang, Clyde L. Monma, 1991-01-01 Reliability problems arise with increasing frequency as our modern systems of telecommunications information transmission transportation and distribution become more and more complex In December 1989 at DIMACS at Rutgers University a Workshop on Reliability of Computer and Communications Networks was held to examine the discrete mathematical methods relevant to these problems There were nearly ninety participants including theoretical mathematicians computer scientists and electrical engineers from academia and industry as well as network practitioners engineers and reliability planners from leading companies involved in the use of computer and communications networks This volume published jointly with the Association for Computing Machinery contains the proceedings from this Workshop The aim of the Workshop was to identify the latest trends and important open problems as well as to survey potential practical applications The Workshop explored questions of computation of reliability of existing systems and of creating new designs to insure high reliability in addition to the closely related notion of survivability Redundancy single stage and multistage networks interconnected networks and fault tolerance were also covered The Workshop emphasized practical applications with many invited speakers from a variety of companies which are dealing with practical network reliability problems The success of the Workshop in fostering many new interactions among researchers and practitioners is reflected in the proceedings which provide an exciting look at some of the major advances at the forefront of this important field of research

The Reliability of the Computer Communication Networks Including Mobile Nodes Sahin Yasar, 2006 *Computers, Communication, and Mental Models* Donald L. Day, 2020-09-23 Computers Communication and Mental Models is a far ranging focused treatment of the cognitive and

behavioural issues in computer mediated communication knowledge representation and computer supported co operative work It is also an argued development of the theoretical bases for treating computerized tools as intermediaries in the communication of mental maps between tool builders and users Empirical trails are reported in detail sufficient for representation in computer based instruction fractal dimensions of cognitive mapping and group decision support The book is a collection of multidisciplinary papers which each shed light on the complex interactions between users and systems architects via a common medium computerized tools Modeling and Analysis of Computer Communications Networks

Jeremiah F. Hayes, 2013-03-08 In large measure the traditional concern of communications engineers has been the conveyance of voice signals The most prominent example is the telephone network in which the techniques used for transmission multiplexing and switching have been designed for voice signals However one of the many effects of computers has been the growing volume of the sort of traffic that flows in networks composed of user terminals processors and peripherals The characteristics of this data traffic and the associated performance requirements are quite different from those of voice traffic These differences coupled with burgeoning digital technology have engendered a whole new set of approaches to multiplexing and switching this traffic The new techniques are the province of what has been loosely called computer communications networks The subject of this book is the mathematical modeling and analysis of computer communications networks that is to say the multiplexing and switching techniques that have been developed for data traffic The basis for many of the models that we shall consider is queueing theory although a number of other disciplines are drawn on as well The level at which this material is covered is that of a first year graduate course It is assumed that at the outset the student has had a good undergraduate course in probability and random processes of the sort that are more and more common among electrical engineering and computer science departments **Distributed Computer Control Systems**

1991 H. Kopetz, M.G. Rodd, 2014-07-04 Distributed computer control is at the intersection between control engineering and computer science Containing 22 papers this book provides an up to date reference source of important issues in the design and implementation of distributed real time computer systems **Advanced Wireless Networks** Savo G. Glisic, 2016-07-22 The third edition of this popular reference covers enabling technologies for building up 5G wireless networks Due to extensive research and complexity of the incoming solutions for the next generation of wireless networks it is anticipated that the industry will select a subset of these results and leave some advanced technologies to be implemented later This new edition presents a carefully chosen combination of the candidate network architectures and the required tools for their analysis Due to the complexity of the technology the discussion on 5G will be extensive and it will be difficult to reach consensus on the new global standard The discussion will have to include the vendors operators regulators as well as the research and academic community in the field Having a comprehensive book will help many participants to join actively the discussion and make meaningful contribution to shaping the new standard **Computer-Communication Networks**

James S. Meditch, Wesley W. Chu, 2014-05-23 *Computer Communication Networks* presents a collection of articles the focus of which is on the field of modeling analysis design and performance optimization It discusses the problem of modeling the performance of local area networks under file transfer It addresses the design of multi hop mobile user radio networks Some of the topics covered in the book are the distributed packet switching queuing network design some investigations on communication switching techniques in computer networks and the minimum hop flow assignment and routing subject to an average message delay constraints The analysis of the multi access communication channel is covered The local area network file transfers are discussed The text describes the C PODA protocol The congestion control scheme for window flow controlled computer network is presented A chapter of the volume is devoted to the description of a fairness control algorithm Another section of the book focuses on the analysis of hierarchical model The book will provide useful information to computer programmers network analysts students and researchers
