Design of Interconnection Networks for Programmable Logic Guy Lemieux, David Lewis, 2013-06-29 Programmable Logic Devices PLDs have become the key implementation medium for the vast majority of digital circuits designed today While the highest volume devices are still built with full fabrication rather than field programmability the trend towards ever fewer ASICs and more FPGAs is clear This makes the field of PLD architecture ever more important as there is stronger demand for faster smaller cheaper and lower power programmable logic PLDs are 90% routing and 10%

logic This book focuses on that 90% that is the programmable routing the manner in which the programmable wires are connected and the circuit design of the programmable switches themselves Anyone seeking to understand the design of an FPGA needs to become literate in the complexities of programmable routing architecture This book builds on the state of the art of programmable interconnect by providing new methods of investigating and measuring interconnect structures as well as new programmable switch basic circuits The early portion of this book provides an excellent survey of interconnect structures and circuits as they exist today Lemieux and Lewis then provide a new way to design sparse crossbars as they are used in PLDs and show that the method works with an empirical validation This is one of a few routing architecture works that employ analytical methods to deal with the routing architecture design The analysis permits interesting insights not typically possible with the standard empirical approach

Integrated Circuit and System Design. Power and Timing Modeling, Optimization and Simulation Vassilis Paliouras, Johan Vounckx, Diederik Verkest, 2005-08-25 Welcome to the proceedings of PATMOS 2005 the 15th in a series of international workshops PATMOS 2005 was organized by IMEC with technical co sponsorship from the IEEE Circuits and Systems Society Over the years PATMOS has evolved into an important European event where searchers from both industry and academia discuss and investigate the emerging challenges in future and contemporary applications design methodologies and tools required for the

development of upcoming generations of integrated circuits and systems. The technical program of PATMOS 2005 contained state-of-the-art technical contributions, three invited talks, a special session on hearing aid design, and an embedded tutorial. The technical program focused on timing performance and power consumption as well as architectural aspects with particular emphasis on modeling, design characterization, analysis, and optimization in the nanometer era. The Technical Program Committee, with the assistance of additional expert reviewers, selected the 74 papers to be presented at PATMOS. The papers were divided into 11 technical sessions and 3 poster sessions. As is always the case with the PATMOS workshops, the review process was anonymous; full papers were required, and several reviews were carried out per paper. Beyond the presentations of the papers, the PATMOS technical program was enriched by a series of speeches offered by world-class experts on important emerging research issues of industrial relevance. Prof. Jan Rabaey (Berkeley, USA) gave a talk on "Traveling the Wild Frontier of Ultra Low Power Design." Dr. Sung Bae Park (Sung) gave a presentation on "DVL: Deep Low Voltage Circuits and Devices." Prof.

Fine- and Coarse-Grain Reconfigurable Computing Stamatis Vassiliadis, Dimitrios Soudris, 2007-10-12. Fine and Coarse Grain Reconfigurable Computing gives the basic concepts and building blocks for the design of Fine or FPGA and Coarse Grain Reconfigurable Architectures. Recently developed integrated architecture design and software supported design flow of FPGA and coarse grain reconfigurable architecture are also described. Part I consists of two extensive surveys of FPGA and Coarse Grain Reconfigurable Architectures. The FPGA technology is defined, which includes architecture, logic block structure, interconnect, and configuration methods, and existing fine grain reconfigurable architectures emerged from both academia and industry. Additionally, the implementation techniques and CAD tools developed to facilitate the implementation of a system in reconfigurable hardware by the industry and academia are provided. In addition, the features, advantages, and limitations of the coarse grain reconfigurable systems, the specific issues that should be addressed during the design phase, as well as representative existing coarse grain reconfigurable systems are explained. In Part II, case studies, innovative research results about reconfigurable architectures and design frameworks from three projects: AMDREL, MOLEN, and ADRES, DRESC, and a new classification according to microcoded architectural criteria are described. Fine and Coarse Grain Reconfigurable Computing is an essential reference for researchers and professionals and can be used as a textbook by undergraduate, graduate students, and professors.
