## **Lowland Floodplain Rivers Geomorphological Perspectives:**

**Lowland Floodplain Rivers** P. A. Carling, G. E. Petts, 1992      **Geomorphic Approaches to Integrated Floodplain Management of Lowland Fluvial Systems in North America and Europe** Paul F. Hudson, Hans Middelkoop, 2015-04-29

This volume provides a comprehensive perspective on geomorphic approaches to management of lowland alluvial rivers in North America and Europe. Many lowland rivers have been heavily managed for flood control and navigation for decades or centuries resulting in engineered channels and embanked floodplains with substantially altered sediment loads and geomorphic processes. Over the past decade floodplain management of many lowland rivers has taken on new importance because of concerns about the potential for global environmental change to alter floodplain processes necessitating revised management strategies that minimize flood risk while enhancing environmental attributes of floodplains influenced by local embankments and upstream dams. Recognition of the failure of old perspectives on river management and the need to enhance environmental sustainability has stimulated a new approach to river management. The manner that river restoration and integrated management are implemented however requires a case study approach that takes into account the impact of historic human impacts to the system especially engineering. The river basins examined in this volume provide a representative coverage of the drainage of North America and Europe taking into account a range of climatic and physiographic provinces. They include the 1 Sacramento California USA 2 San Joaquin California 3 Missouri Missouri USA 4 Red Manitoba Canada and Minnesota USA 5 Mississippi Louisiana USA 6 Kissimmee Florida USA 7 Ebro Spain 8 Rhone France 9 Rhine Netherlands 10 Danube Romania and 11 Volga Russian Federation Rivers. The case studies covered in these chapters span a range of fluvial modes of adjustment including sediment channel hydrologic regime floodplains as well as ecosystem and environmental associations.

**Theoretical Morphodynamics: River Meandering** Giovanni Seminara, Stefano Lanzoni, Nicoletta Tambroni, 2024-04-05. This monograph discusses the mechanics of Meandering Rivers with the help of the mathematical and modeling tools built up in the previous monograph of the same Authors monograph 1 of the present series. After introducing the reader to the ubiquitous character of meandering streams we discuss the hydrodynamics of curved channels with fixed beds and banks. Next we extend the analysis to account for the mobile character of the bed and show that it gives rise to the alternate sequence of riffles and pools that characterize river meanders. Allowing for the erodible character of the river banks then allows to build up a rational theory of meander formation able to explain most of the features observed in nature: meander growth, migration, skewing, multiple loops, cutoffs and meander belts.

**Geomorphology and River Management** Gary J. Brierley, Kirstie A. Fryirs, 2013-04-29. This book outlines a generic set of procedures termed the River Styles Framework which provides a set of tools for interpreting river character, behavior, condition and recovery potential. Applications of the framework generate a coherent package of geomorphic information providing a physical template for river rehabilitation activities. Management and restoration of rivers is a rapidly growing

topic for environmental scientists geologists and ecologists this book provides a learning tool with which to approach geomorphic applications to river management describes the essential geomorphological principles underlying river behaviour and evolution demonstrates how the River Styles Framework can turn geomorphic theory into practice to develop workable strategies for restoration and management based on real case studies and authors extensive experience applicable to river systems worldwide synthesises fluvial geomorphology ecology and management *Floodplains* Susan B. **Analysis and Modelling of River Meandering** Alessandra Crosato, 2008 This thesis examines the morphological changes of non tidal meandering rivers at the spatial scale of several meanders With this purpose a physics based mathematical model MIANDRAS has been developed for the simulation of the medium term to long term evolution of meandering rivers Application to several real rivers shows that MIANDRAS can properly simulate both equilibrium river bed topography and planimetric changes Three models of different complexity can be obtained by applying different degrees of simplification to the equations These models along with experimental tests and field data constitute the tools for several analyses At conditions of initiation of meandering it is found that river bends can migrate upstream and downstream This depends on meander wave length and width to depth ratio irrespective of whether the parameters are in the subresonant or the superresonant range Coastal Landscapes of South Australia Robert P. Bourman, Colin V. Murray-Wallace, Nick Harvey, 2016-08-09 Geologically the South Australian coast is very young having evolved over only 1% of geological time during the past 43 million years since the separation of Australia and Antarctica It is also very dynamic with the current shoreline position having been established from only 7000 years ago The South Australian mainland coast is 3816 km long with islands providing an additional 1251 km of coast giving a total coastline of just over 5000 km South Australian coastal landforms include cliffs rocky outcrops and shore platforms mangrove woodlands mudflats estuaries extensive sandy beaches
