Neurochemical Monitoring In The Intensive Care Unit:

Neurochemical Monitoring in the Intensive Care Unit Takashi Tsubokawa,Anthony Marmarou,Claudia Robertson,Graham Teasdale,2012-12-06 Neurophysiological recording is the major neuromonitoring technique employed in ICU In addition continuous recording of intracranial pressure has proved to provide information useful for critical care of the patient with severe brain damage It is however difficult to assess neurochemical and or metabolic environments of the brain with these conventional neuromonitoring techniques Information regarding these changes if available on a real time basis is undoubtedly useful for patient care Many important developments in bedside techniques to monitor these changes have been achieved during the last few years It was the consensus of the editors that a symposium to exchange knowledge concerning recent advances in such techniques would be valuable With this background the First International Symposium of Neurochemical Monitoring in ICU held May 20 21 1994 in Tokyo Japan It was not the intention of the organizers that this symposium should survey the whole field of neuromonitoring in ICU The symposium was thus focused on clinical application of microdialysis jugular venous oximetry and near infrared spectroscopy which currently appear to be the most promising techniques for monitoring neurochemical and metabolic changes in the brain in a clinical setting We termed these techniques collectively as neurochemical monitoring contrasting them with neurophysiological monitoring in ICU The concept that has motivated this symposium was to provide an opportunity to exchange up to date summaries on issues currently debated for these techniques This volume is based on the papers presented at the symposium
