Plant Physiology A Treatise Volume 2 Plants:

Embryology of Flowering Plants: Terminology and Concepts, Vol. 2 T B Batygina, 2005-01-11 This volume covers up to date notions of seed structure processes resulting to its formation syngamy triple fusion etc as well as of postseminal development seed dormancy and germination Great attention has been paid to the morphological and functional aspects of fertilization process and embryo and endospermogenesis

Plant Physiology Hans Mohr, Peter Schopfer, 2012-12-06 In this comprehensive and stimulating text and reference the authors have succeeded in combining experimental data with current hypotheses and theories to explain the complex physiological functions of plants For every student teacher and researcher in the plant sciences it offers a solid basis for an in depth understanding of the entire subject area underpinning up to date research in plant physiology The authors vividly explain current research by references to experiments they cite original literature in figures and tables and at the end of each chapter list recent references that are relevant for a deeper analysis of the topic In addition an abundance of detailed and informative illustrations complement the text

Transport in Plants I M.H. Zimmermann, J.A. Milburn, 2012-12-06 When WILHELM RUHLAND developed his plan for an Encyclopedia of Plant Physiology more than three decades ago biology could still be conveniently subdivided into classical areas Even within plant physiology subdivisions were not too difficult to make and general principles could be covered sufficiently in the two introductory volumes of the Encyclopedia on the physical and chemical basis of cell biology But the situation changed rapidly even during the 12 year publication period of the Encyclopedia 1955 1967 The new molecular direction of genetics and structural research on biopolymers had an integrating effect on all other biological fields including plant physiology and it became increasingly difficult to keep previously distinct areas separated RUHLAND S overall plan included 18 volumes and about 22 000 pages It covered the entire field of plant physiology in most cases from the very beginning But as each volume appeared it was clear that its content would soon be outdated

Biology, Controls and Models of Tree Volatile Organic Compound Emissions Ülo Niinemets, Russell K. Monson, 2013-07-08 Plant driven volatile organic compound BVOC emissions play a major role in atmospheric chemistry including ozone and photochemical smog formation in the troposphere and they extend the atmospheric lifetime of the key greenhouse gas methane Furthermore condensation of photo oxidation products of BVOCs leads to formation of secondary organic aerosols with profound implications for the earth s solar radiation budget and climate Trees represent the plant life form that most contributes to BVOC emissions which gives global forests a unique role in regulating atmospheric chemistry Written by leading experts in the field the focus is on recent advancements in understanding the controls on plant driven BVOC emissions including efforts to quantitatively predict emissions using computer models particularly on elicitation of emissions under biotic and abiotic stresses molecular mechanisms of volatile synthesis and emission and the role of emissions in plant stress tolerance

Natural Products of Woody Plants John W. Rowe, 2012-12-06 Wood as found in trees and bushes was of primary importance to ancient humans in their struggle to

control their environment Subsequent evolution through the Bronze and Iron Ages up to our present technologically advanced society has hardly diminished the importance of wood Today its role as a source of paper products furniture building materials and fuel is still of major significance Wood consists of a mixture of polymers often referred to as lignocellulose The cellulose microfibrils consist of an immensely strong linear polymer of glucose They are associated with smaller more complex polymers composed of various sugars called hemicelluloses These polysaccharides are embedded in an amorphous phenylpropane polymer lignin creating a remarkably strong composite structure the lignocellulosic cell wall Wood also contains materials that are largely extraneous to this lignocellulosic cell wall These extracellular substances can range from less than 1070 to about 35% of the dry weight of the wood but the usual range is 2% 10% Among these components are the mineral constituents salts of calcium potassium sodium and other metals particularly those present in the soil where the tree is growing Some of the extraneous components of wood are too insoluble to be extracted by inert solvents and remain to give extractive free wood its color very often these are high molecular weight polyphenolics
