Real Time Programming 1995:

Real Time Programming 1995 (WRTP '95) Phillip Laplante, Phillip A. Laplante, Wolfgang A. Halang, 1996 These proceedings contain the papers presented at the 20th IFAC IFIP Annual Workshop on Real Time Programming WRTP 95 held in Florida USA on 6-10 November 1995. The unifying theme of the Workshop was the problem presented by the design, construction and maintenance of complex computer systems which are important in sectors such as manufacturing, communications, defence, transportation, aerospace, hazardous environments, energy and health care. These systems frequently include distributed heterogeneous networks and are constrained by requirements on performance, real time behaviour, fault tolerance, security, adaptability, development time and cost, long life concerns and other areas. The papers were grouped under various topics: complex and dependable real time systems, formal methods, languages, tools and environments, systems and software engineering, advanced applications such as imaging, database systems and heterogeneous systems, and reflect the desire to bring together industrial, academic and government experts from various disciplines and to promote long term research. Computer Aided And Integrated Manufacturing Systems (A 5-volume Set) - Volume 5: Manufacturing Processes Cornelius T. Leondes, 2003-09-29 This is an invaluable five volume reference on the very broad and highly significant subject of computer aided and integrated manufacturing systems. It is a set of distinctly titled and well harmonized volumes by leading experts on the international scene. The techniques and technologies used in computer aided and integrated manufacturing systems have produced and will no doubt continue to produce major annual improvements in productivity which is defined as the goods and services produced from each hour of work. This publication deals particularly with more effective utilization of labor and capital, especially information technology systems. Together the five volumes treat comprehensively the major techniques and technologies that are involved. **Computer Aided and Integrated Manufacturing Systems** Cornelius T. Selic, 2007-05-08 The complexity of most real time and embedded systems often exceeds that of other types of systems since in addition to the usual spectrum of problems inherent in software they need to deal with the complexities of the physical world. That world, as the proverbial Mr Murphy tells us, is an unpredictable and often unfriendly place. Consequently, there is a very strong motivation to investigate

and apply advanced design methods and technologies that could simplify and improve the reliability of real time software design and implementation As a result from the first versions of UML issued in the mid 1990 s designers of embedded and real time systems have taken to UML with vigour and enthusiasm However the dream of a complete model driven design flow from specification through automated optimised code generation has been difficult to realise without some key improvements in UML semantics and syntax specifically targeted to the real time systems problem With the enhancements in UML that have been proposed and are near standardisation with UML 2 0 many of these improvements have been made In the Spring of 2003 adoption of a formalised UML 2 0 specification by the members of the Object Management Group OMG seems very close It is therefore very appropriate to review the status of UML as a set of notations for embedded real time systems both the state of the art and best practices achieved up to this time with UML of previous generations and where the changes embodied in the 2
