Recent Advances in Differential Equations Roberto Conti, 2014-05-10 *Recent Advances in Differential Equations* contains the proceedings of a meeting held at the International Center for Theoretical Physics in Trieste Italy on August 24-28 1978 under the auspices of the U S Army Research Office. The papers review the status of research in the field of differential equations ordinary partial and functional. Both theoretical aspects: differential operators, periodic solutions, stability and bifurcation, asymptotic behavior of solutions etc. and problems arising from applications: reaction-diffusion equations, control problems, heat flow etc. are discussed. Comprised of 33 chapters, this book first examines non-cooperative trajectories of n person dynamical games and stable non-cooperative equilibria, followed by a discussion on the determination and application of Vekua resolvents. The reader is then introduced to generalized Hopf bifurcation, some Cauchy problems arising in computational methods and boundary value problems for pairs of ordinary differential operators. Subsequent chapters focus on degenerate evolution equations and singular optimal control, stability of neutral functional differential equations, local exact controllability of nonlinear evolution equations and turbulence, and higher order bifurcations. This monograph will be of interest to students and practitioners in the field of mathematics.

Recent Advances in Computational Fluid Dynamics

C.C. Chao, Steven A. Orszag, W. Shyy, 2013-03-07 From the preface: Fluid dynamics is an excellent example of how recent advances in computational tools and techniques permit the rapid advance of basic and applied science. The development of computational fluid dynamics (CFD) has opened new areas of research and has significantly supplemented information available from experimental measurements. Scientific computing is directly responsible for such recent developments as the secondary instability theory of transition to turbulence, dynamical systems analyses of routes to chaos, ideas on the geometry of turbulence, direct simulations of turbulence, three-dimensional full aircraft flow analyses, and so on. We believe that CFD has already achieved a status in the tool kit of fluid mechanicians equal to that of the classical scientific techniques of mathematical analysis and laboratory experiment.

Recent Advances in Algorithmic Differentiation Shaun Forth, Paul Hovland, Eric Phipps, Jean Utke, Andrea Walther, 2012-07-30 The proceedings represent the state of knowledge in the area of algorithmic differentiation (AD). The 31 contributed papers presented at the AD2012 conference cover the application of AD to many areas in science and engineering as well as aspects of AD theory and its implementation in tools. For all papers, the referees selected from the program committee and the greater community as well as the editors have emphasized accessibility of the presented ideas also to non-AD experts. In the AD tools arena, new implementations are introduced covering, for example, Java and graphical modeling environments or join the set of existing tools for Fortran. New developments in AD algorithms target the efficiency of matrix operation, derivatives detection and exploitation of sparsity, partial separability, the treatment of nonsmooth functions, and other high-level mathematical aspects of the numerical

computations to be differentiated Applications stem from the Earth sciences nuclear engineering fluid dynamics and chemistry to name just a few In many cases the applications in a given area of science or engineering share characteristics that require specific approaches to enable AD capabilities or provide an opportunity for efficiency gains in the derivative computation The description of these characteristics and of the techniques for successfully using AD should make the proceedings a valuable source of information for users of AD tools
