

Revolutions & Radians

- Radians are defined as arc length divided by radius length. In a complete circle the circumference is the arc length and is calculated by the equation $C = 2 \pi R$ where R is the radius. Dividing the arc (the circumference) by the radius, we get $2 \pi R / R$ gives 2π . The number of radians in one complete circle then is 2π .
- $1 \text{ revolution} = 360 \text{ degrees} = 2 \pi \text{ radians}$
- Linear distance can be calculated by multiplying the angular displacement times the radius.
- $s = \theta R$
- Frequency is the number of revolutions per second and since each revolution is 2π radians, radians per second can be calculated by $2 \pi \times \text{frequency}$. Angular velocity is measured in radians per second therefore, angular velocity can be calculated as $2 \pi f$.
- $\omega = 2 \pi f$ and since $f = 1 / T$ so $\omega = 2 \pi / T$
