Renal Protective Effect Of Ace Inhibition And Angiotensin Ii Blockade:

Renal Protective Effect of ACE Inhibition and Angiotensin II Blockade Giuseppe Remuzzi, 1996-01-01 This timely issue reviews new therapeutic strategies for preventing or delaying renal disease progression Special attention is given to pharmacologic interventions aimed at inhibiting the synthesis of angiotensin II or blocking its biological activity at the receptor level The papers presented in this issue provide thorough coverage of the topic from the role of the renin angiotensin system in the local control of renal function to the protective effects of ACE inhibitors in diabetes Taken together the studies document that when urinary protein excretion is reduced by pharmacologic interventions a proportional reduction in the rate of renal disease progression can be achieved Clinical trials are now being carried out to investigate whether angiotensin II receptor blockade offers advantages compared to ACE inhibitors in slowing renal disease progression All those wishing to learn about the latest advances will appreciate this valuable update *Seldin and Giebisch's The Kidney* Robert J. Angiotensin II Receptor Blockade Physiological and Clinical Implications Naranjan S. Dhalla, Peter Zahradka, Ian M.C. Dixon, Robert E. Beamish, 2012-12-06 The relationship between angiotensin II and hypertension was established in 1898 when angiotensin II was shown to modulate systemic blood pressure Over the intervening decades a complete characterization of the renin angiotensin system RAS has been achieved and our understanding of its biochemistry and physiology has led to the directed development of agents such as ACE inhibitors and receptor antagonists capable of controlling hypertension More recently it was shown that angiotensin II is secreted within certain tissues and that these tissue specific systems operate independently of the systemic RAS The novel concept that angiotensin II regulates a number of cardiovascular processes that are unrelated to blood pressure has renewed the interest of both basic and clinical scientists in angiotensin II The association between angiotensin II and cardiac growth in particular has indicated that therapies currently in use for hypertension may have direct application to the treatment of heart failure The Manitoba Cardiovascular Forum on Angiotensin Receptor Blockade in Winnipeg was convened October 18-20 1996 to examine the clinical and basic aspects of angiotensin receptor biology as they apply to hypertension and heart failure In addition the potential treatment of these conditions using specific angiotensin receptor antagonists was addressed within the context of their immediate therapeutic application and future potential Angiotensin II Receptor Antagonists Mancina Giuseppe, 2000-07-03 Since angiotensin II is one of the most potent vasoconstrictors and an important stimulus for the secretion of aldosterone from the adrenal gland the development of angiotensin II inhibitors is an important step in regulating blood pressure This class of drug is well tolerated by patients and these drugs have the added advantage over ACE inhibitors in that they are not associated with cough Because most drugs can be given once daily and like ACE inhibitors they have a useful additive hypotensive effect in combination with diuretics they are a welcome therapeutic tool in the treatment of hypertension
