Low Cost Approach To Pcr:

A Low-Cost Approach to PCR Eva Harris, 1998-12-31 The polymerase chain reaction PCR is a technique used to replicate specific pieces of DNA millions of times which permits the detection and analysis of minute amounts of nucleic acids Since its introduction in the late 1980s this technique has been applied not only in molecular biology research but also in fields as diverse as anthropology phylogeny and forensics However despite the large impact of PCR many of its applications remain within the confines of research and the academic environment Now in *A Low Cost Approach to PCR* Appropriate Transfer of Biomolecular Techniques Dr Eva Harris makes this elegantly simple technique more accessible to researchers physicians and laboratory workers throughout the world She provides a description of the theoretical basis of the technique the practical details of the method and the philosophy behind the technology transfer program that she developed over the last ten years The book serves as a guide for potential users in developing countries and for scientists in developed countries who may wish to work abroad In addition the low cost approach outlined in this book can be useful for high school undergraduate or continuing education programs in the United States While the specific applications of PCR outlined in the book are immediately useful to the study of infectious diseases the approach presented can be generalized to a number of other technologies and situations The book will help laboratories in many areas of the world generate information on site for use by physicians epidemiologists public health workers and health policy professionals to develop new strategies for disease control

Development of Practical Methods to Assess the Presence of Bacterial Pathogens in Water W. A.

Yanko,2004-03-01 The objective of this project was to develop and evaluate a practical technique to indicate the probability of the presence of bacterial pathogens in receiving waters A practical method was defined as one that would limit the use of defined culture based microbiological methods and would be based on 1 validating indicator organisms that predicted the presence of pathogens or 2 detection of pathogens by polymerase chain reaction PCR based assays The study also assessed the utility of PCR based technology for bacterial pathogen detection with respect to technology transfer to a wider range of water and wastewater facilities
