Handy numbers: finger counting and numerical cognition Frank Domahs, Liane Kaufmann, Martin H. Fischer, We are born with a number sense the ability to respond to numerosity which we share with other vertebrates This inherited numerosity representation is approximate and follows the Weber Fechner law that governs sensory perception As educated adults we can also use culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic numbers This developmental stage is preceded by an apparently transient phase of finger counting and finger calculation In fact the use of fingers to represent number is ubiquitous across ages and cultures Children use finger counting even if they are discouraged to do so sometimes even before they are able to utter the number word sequence Furthermore finger counting strategies may also be used by adults diagnosed with dyscalculia to make up for a deficient or absent mental number representation The advantages of finger counting are evident Fingers are readily available and perceptually salient finger numerical representations support short term memory and they provide a transparent one to one relationship between to be counted objects and their representation Obviously however these advantages only hold for small numbers Fully transparent finger counting systems are limited to the number range between zero and ten Larger numbers can only be represented in perceptually less salient or symbolic ways In recent years a growing body of evidence has suggested that finger based representations of number do not form an arbitrary and transient stage of cognitive development Rather they seem to provide a good example of embodied cognition According to this influential viewpoint all of our knowledge is represented together with the sensory and motor activity that was present during its acquisition As a consequence even a supposedly abstract cognitive ability such as numerical cognition reuses the neural substrate and inherits functional properties of more basic perceptual and or motor processes Consistent with this assumption finger counting habits and numerical processing do interact even in educated adults casting doubts on purely abstract accounts of mental number representations The objective of this Research Topic is to document embodiment signatures in number processing and calculation a domain of cognition that was long considered to epitomize the abstract symbol manipulation approach to human cognition To this end we invite empirical contributions using different methodologies including behavioural developmental neuroscientific educational cross cultural and neuropsychological studies Moreover we also seek theoretical contributions review articles or opinion papers Questions to be tackled may include but are not restricted to the following Is finger counting only a useful or even a necessary step towards the acquisition of symbolic number representations What are the neural correlates of the finger number relationship Which features of finger counting influence adult number processing both approximate and exact How can finger counting systems be classified typologically and how do different finger counting systems influence numerical cognition across cultures and populations Should finger counting and finger calculation be promoted or discouraged in maths education How are

disturbances of finger gnosis and numerical abilities linked We hope that this Research Topic will bring together researchers from different backgrounds to fruitfully discuss a topic which has both scientific and every day relevance **Brain and Mathematical Cognition** Xinlin Zhou,2024-08-01 This book intends to present a series of insights coming from in depth investigation of brain and mathematical cognition in Chinese population Specifically the book introduces research on the associations among number sense visual form perception and mathematical fluency symbolic and non symbolic mental number line and the role of spatial modeling and logical inference in mathematical problem solving The book summarizes author s previous studies on the involvement of semantic network other than visuospatial network in mathematical cognition The three component mathematical model that comes out of more than 10 years of research on mathematical cognition is introduced The book presents the effect of learning experience on arithmetic related brain system Chinese abacus that can be used to eradicate developmental dyscalculia in classroom is briefly discussed Special attention in this book is paid to mathematical anxiety and mathematical learning disorders in Chinese schoolchildren Finally gender differences in mathematical cognition are also reviewed **Fundamental Concepts of Geometry** Bruce E. Meserve,2014-12-08

Demonstrates relationships between different types of geometry Provides excellent overview of the foundations and historical evolution of geometrical concepts Exercises no solutions Includes 98 illustrations **Integers and Theory of Numbers** Abraham Adolf Fraenkel,2004-01-01 A concise work on important topics in number theory this classic text was devised by a prominent mathematician to explain the essentials of mathematics in a manner accessible to high school and college students as well as to other readers Clear cut explanations cover natural numbers as cardinals with discussions of positional notation and the ordering of numbers according to magnitude natural numbers as ordinals including Peano s axioms and the relation of ordinals to cardinals the theory of numbers encompassing prime numbers and their distribution partitions of the circle Fermat s simple and last theorems perfect numbers amicable numbers and algebraic and ideal numbers and rational numbers with considerations of positive fractions negative integers and the field of rationals 1955 ed **Parallel**

Processing for Artificial Intelligence 3 J. Geller,H. Kitano,C.B. Suttner,1997-02-10 The third in an informal series of books about parallel processing for Artificial Intelligence this volume is based on the assumption that the computational demands of many AI tasks can be better served by parallel architectures than by the currently popular workstations However no assumption is made about the kind of parallelism to be used Transputers Connection Machines farms of workstations Cellular Neural Networks Crays and other hardware paradigms of parallelism are used by the authors of this collection The papers arise from the areas of parallel knowledge representation neural modeling parallel non monotonic reasoning search and partitioning constraint satisfaction theorem proving parallel decision trees parallel programming languages and low level computer vision The final paper is an experience report about applications of massive parallelism which can be said to capture the spirit of a whole period of computing history This volume provides the reader with a snapshot of the state of the

art in Parallel Processing for Artificial Intelligence **Math Phonics - Subtraction (eBook)** Marilyn B. Hein,1997-03-01 In just minutes a day students can master math facts with this specially designed program Using rules patterns and memory tools similar to those used in language arts Math Phonics tm is great for introducing concepts or providing alternative techniques **Top Secret Sudoku System** Stephen Kerr,2007-06-18 What if you could solve any Sudoku puzzle with a bare

minimum of penciling in and erasing usually one or two penciled in numbers per cell and never more than three no educated guesses and do it in less than half the time it takes you to solve a puzzle now Well we have developed an incredibly simple yet amazingly powerful system which limits the confusion of having four five or more contingencies penciled in for each cell and can solve almost any Sudoku puzzle This is not to say that we have taken the logic or the challenge out of solving Sudoku puzzles we have not You must still be thoughtful thorough and sometimes imaginative but you will have much MORE FUN solving them with much less tedium and frustration **Mathematics Accomplished** ,2001 Help children who are lagging behind in Year 6 and bring them up to the national standard in maths Intended for use with small booster groups 40 crisp focused lessons that tackle key problems 42 photocopiable resource sheets practise activities and assessment pointers

Mastering Math Manipulatives, Grades K-3 Sara Delano Moore,Kimberly Rimbey,2021-10-04 Mastering Math Manipulatives includes everything you need to integrate math manipulatives both concrete and virtual into math learning Each chapter of this richly illustrated easy to use guide focuses on a different powerful tool such as two color counters linking cubes base ten blocks fraction manipulatives pattern blocks tangrams geometric solids and others and includes a set of activities that demonstrate the many ways teachers can leverage manipulatives to model and reinforce math concepts for all learners Parallel Processing for Artificial Intelligence 1 L.N. Kanal,H. Kitano,V. Kumar,C.B. Suttner,2014-06-28

Parallel processing for AI problems is of great current interest because of its potential for alleviating the computational demands of AI procedures The articles in this book consider parallel processing for problems in several areas of artificial intelligence image processing knowledge representation in semantic networks production rules mechanization of logic constraint satisfaction parsing of natural language data filtering and data mining The publication is divided into six sections The first addresses parallel computing for processing and understanding images The second discusses parallel processing for semantic networks which are widely used means for representing knowledge methods which enable efficient and flexible processing of semantic networks are expected to have high utility for building large scale knowledge based systems The third section explores the automatic parallel execution of production systems which are used extensively in building rule based expert systems systems containing large numbers of rules are slow to execute and can significantly benefit from automatic parallel execution The exploitation of parallelism for the mechanization of logic is dealt with in the fourth section While sequential control aspects pose problems for the parallelization of production systems logic has a purely declarative interpretation which does not demand a particular evaluation strategy In this area therefore very large search spaces provide

significant potential for parallelism In particular this is true for automated theorem proving The fifth section considers the problem of constraint satisfaction which is a useful abstraction of a number of important problems in AI and other fields of computer science It also discusses the technique of consistent labeling as a preprocessing step in the constraint satisfaction problem Section VI consists of two articles each on a different important topic The first discusses parallel formulation for the Tree Adjoining Grammar TAG which is a powerful formalism for describing natural languages The second examines the suitability of a parallel programming paradigm called Linda for solving problems in artificial intelligence Each of the areas discussed in the book holds many open problems but it is believed that parallel processing will form a key ingredient in achieving at least partial solutions It is hoped that the contributions sourced from experts around the world will inspire readers to take on these challenging areas of inquiry
