Volume 1. State of the Art ,1991 This report presents an assessment of the state of the art of airport pavement analysis and design The objective is to identify those areas in current airport pavement analysis methodology that need to be substantially improved from the perspective of airport pavement design and management needs The report presents a rational argument for developing a unified pavement analysis and design procedure that can be used for pavements of any material type including reinforced concrete and asphalt and that are based on mathematical formulations of the actual stress strain response processes in airport pavement materials Material behaviors can be difficult to predict with respect to their structural response to loads and environmental conditions Material characteristics change with time environmental conditions and stress strain relations and history There is no consensus definition of airport pavement failure Design procedures prescribe a pavement thickness for protecting subgrades from excessive deformation Fatigue cracking of pavements is a relatively common occurrence but cracking alone is not necessarily an indication of failure Pavement failure May be defined with respect to the serviceability level a concept related to the roughness of the traveling surfaces

Characterizing Temperature Effects for Pavement Analysis and Design Marshall R. Thompson, 1987 *Long and Deep Tunnels* Vittorio Guglielmetti, Shulin Xu, Gianni Alberto Arrigoni, Piergiorgio Grasso, 2016-04-15 The design and construction of long and deep tunnels i e tunnels under mountains characterised by either considerable length and or overburden represent a considerable challenge The scope of this book is not to instruct how to design and construct such tunnels but to share a method to identify the potential hazards related to the process of designing and constructing long and deep tunnels to produce a relevant comprehensive analysis and listing to quantify the probability and consequences and to design proper mitigation measures and countermeasures The design developed using probabilistic methods is verified during execution by means of the so called Plan for Advance of the Tunnel PAT method which allows adapting the design and control parameters of the future stretches of the tunnel to the results of the stretches already finished using the monitoring data base Numerous criteria are given to identify the key parameters necessary for the PAT procedure Best practices of excavation management with the help of real time monitoring and control are also provided Furthermore cost and time evaluation systems are analysed Finally contractual aspects related to construction by contract are investigated for best development and application of models more appropriate for tunnelling construction contracts The work will be of interest to practising engineers designers consultants and students in mining underground tunnelling transportation and construction engineering as well as to foundation and geological engineers urban planners developers and architects
