Conformal Field Theory and the Worldsheet Approach to D-Branes Andreas Recknagel, Volker Schomerus, 2013-11-28

Boundary conformal field theory is concerned with a class of two dimensional quantum field theories which display a rich mathematical structure and have many applications ranging from string theory to condensed matter physics. In particular the framework allows discussion of strings and branes directly at the quantum level. Written by internationally renowned experts this comprehensive introduction to boundary conformal field theory reaches from theoretical foundations to recent

developments with an emphasis on the algebraic treatment of string backgrounds. Topics covered include basic concepts in conformal field theory with and without boundaries, the mathematical description of strings and D-branes and the geometry of strongly curved spacetime. The book offers insights into string geometry that go beyond classical notions. Describing the theory from basic concepts and providing numerous worked examples from conformal field theory and string theory, this reference is of interest to graduate students and researchers in physics and mathematics. **Quantum Field Theory And**

Condensed Matter Physics: Proceedings Of The 4th Trieste Conference Seifallah Randjbar-daemi, Lu Yu, 1994-03-29

The aim of this interdisciplinary conference was to bring together experts in quantum field theory and condensed matter physics to survey the latest exciting developments in this border line field such as the Chern-Simons field theory and quantum Hall effect, anyon superconductivity, Yang-Baxter equations and quantum groups, conformal field theory and multi-channel Kondo effect, matrix models and quantum gravity etc. This set of proceedings contains brief reviews contributed by leading experts in the field.
