

Principles of Science

Scientific Explanations and Interpretations

Facts, Observations, and Opinions

- **Science** is an inherently objective topic, as it requires facts to explain the world.
- **Facts** are information that are true.
- Facts come from data and results collected from observations and experiments.
- **Data** is factual information that isn't affected by opinions or bias.
- When conducting experiments, scientists can use **observations** and **analysis** to collect facts and predict what happens in the world.

Study Tip

Think about something you've read in a magazine, whether it is an article or a horoscope. Can you identify which are facts, and which are not?

Concept Check

- What is the difference between facts and data?
- Keep a lookout for opinions that sound like facts: investigate where the information comes from and whether it is true or not.

semantic theories in terms of a hermeneutic and interpretive explanatory project The second internalist conception understands semantic theories in terms of the psychological mechanisms in virtue of which meanings are generated It is argued that a fruitful scientific explanation is one that aims to uncover the underlying mechanisms in virtue of which the observable phenomena are made possible and that a scientific semantics should be doing just that If this is the case then a scientific semantics is unlikely to be externalist for reasons having to do with the subject matter and form of externalist theories It is argued that semantics construed hermeneutically is nevertheless a valuable explanatory project The Conduct of Linguistic Inquiry Rudolf P. Scientific Understanding Henk W. de Regt, Sabina Leonelli, Kai Eigner, 2014-08-09 To most scientists and to those interested in the sciences understanding is the ultimate aim of scientific endeavor In spite of this understanding and how it is achieved has received little attention in recent philosophy of science Scientific Understanding seeks to reverse this trend by providing original and in depth accounts of the concept of understanding and its essential role in the scientific process To this end the chapters in this volume explore and develop three key topics understanding and explanation understanding and models and understanding in scientific practice Earlier philosophers such as Carl Hempel dismissed understanding as subjective and pragmatic They believed that the essence of science was to be found in scientific theories and explanations In Scientific Understanding the contributors maintain that we must also consider the relation between explanations and the scientists who construct and use them They focus on understanding as the cognitive state that is a goal of explanation and on the understanding of theories and models as a means to this end The chapters in this book highlight the multifaceted nature of the process of scientific research The contributors examine current uses of theory models simulations and experiments to evaluate the degree to which these elements contribute to understanding Their analyses pay due attention to the roles of intelligibility tacit knowledge and feelings of understanding Furthermore they investigate how understanding is obtained within diverse scientific disciplines and examine how the acquisition of understanding depends on specific contexts the objects of study and the stated aims of research
