Reading Explorations B:

Explorations in Number Theory Cam McLeman, Erin McNicholas, Colin Starr, 2022-12-18 This innovative undergraduate textbook approaches number theory through the lens of abstract algebra. Written in an engaging and whimsical style, this text will introduce students to rings, groups, fields, and other algebraic structures as they discover the key concepts of elementary number theory. Inquiry-based learning (IBL) appears throughout the chapters, allowing students to develop insights for upcoming sections while simultaneously strengthening their understanding of previously covered topics. The text is organized around three core themes: the notion of what a number is and the premise that it takes familiarity with a large variety of number systems to fully explore number theory; the use of Diophantine equations as catalysts for introducing and developing structural ideas; and the role of abstract algebra in number theory, in particular the extent to which it provides the Fundamental Theorem of Arithmetic for various new number systems. Other aspects of modern number theory, including the study of elliptic curves, the analogs between integer and polynomial arithmetic, p -adic arithmetic, and relationships between the spectra of primes in various rings, are included in smaller but persistent threads woven through chapters and exercise sets. Each chapter concludes with exercises organized in four categories: Calculations and Informal Proofs, Formal Proofs, Computation and Experimentation, and General Number Theory Awareness. IBL Exploration worksheets appear in many sections, some of which involve numerical investigations. To assist students who may not have experience with programming languages, Python worksheets are available on the book's website. The final chapter provides five additional IBL explorations that reinforce and expand what students have learned and can be used as starting points for independent projects. The topics covered in these explorations are public key cryptography, Lagrange's four square theorem, units and Pell's Equation, various cases of the solution to Fermat's Last Theorem, and a peek into other deeper mysteries of algebraic number theory. Students should have a basic familiarity with complex numbers, matrix algebra, vector spaces, and proof techniques, as well as a spirit of adventure to explore the numberverse.

Speech and Reading Beatrice de Gelder, Jose Morais, 2017-11-01 Originally published in 1995, this collection of papers introduced a new dimension to the understanding of reading by focusing on the relation between spoken and written language processing. New perspectives on speech and reading are introduced by highlighting aspects of the two linguistic skills that had received little attention in the past. The comparative perspective adopted in this collection presents an innovative focus on speech and the acquisition of alphabetic reading skill. Major new sources of evidence are discussed, like reading in nonconventional input modalities, braille reading, and speech processing in lip reading. Contributors also discuss the reading process in non-alphabetic orthographies and the specifics of the reading acquisition problem in logographic or mixed writing systems like Chinese and Japanese and their relations to underlying speech representations. A central concern of all chapters is the role of phonological processes in different modalities and writings systems and at different stages in the reading acquisition process. Drawing on expertise of the contributors, the book

presents a novel and varied view of the achievements the promises and the challenges facing the researcher once the intimate link between speech and reading comes to the foreground *Israel Exploration Journal Reader* Harry Meyer Orlinsky, Harry M.
