Screening and Management of Potentially Treatable Genetic Metabolic Disorders P.F. Benson, 1984-03-31 1 The success of early diagnosis and therefore of treatment of phenylketonuria inevitably suggests the possibility of early screening and treatment of other genetic metabolic abnormalities This volume contains a summary of papers delivered at a Workshop on Recent Advances in Screening and Management of Potentially Treatable Genetic Metabolic Disorders held under the auspices of the Commission of the European Communities in London U K on the 17th and 18th March 1983 to consider such possibilities The Workshop was not aimed at those disorders for which the principles of treatment and management have been soundly established or for which screening procedures are in general use The papers therefore do not form a comprehensive account of metabolic disorders The topics for discussion were selected mainly to highlight recent discoveries which might be exploited by concerted approaches between different centres especially when the immediate benefits were restricted to only a few centres Recent reports suggest that about 2% of infants with persistent hyperphenylalaninaemia do not respond to treatment by phenylalanine low diets and develop severe brain damage Infants with such Malignant Hyperphenylalaninaemia due to one of several genetic causes of tetrahydrobiopterin deficiency should be rapidly identified since there is evidence that appropriate treatment will prevent brain damage The Workshop considered how appropriate screening could be made generally available
