Pharmacology - Volume II Harry Majewski, 2009-10-29

Pharmacology is a component of Encyclopedia of Biological Physiological and Health Sciences in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty one Encyclopedias Pharmacology is the study of

the actions of chemicals on the body and most usually it is defined as chemicals that can have a therapeutic action to treat disease. Since it looks at the interaction between chemicals and body systems, pharmacology utilizes the basic disciplines of chemistry, biochemistry, physiology, pathology, and microbiology in its practice. Pharmacology is a foundation science for pharmacy, which is the rational prescribing of drugs to treat disease, and the foundation science for toxicology, which is the study of the toxic actions of chemicals on the body. The two volumes are organized in groups of chapters as follows. The first group of chapters discusses pharmacological principles and these include chapters on Pharmacodynamics, Pharmacokinetics, Neuropharmacology, Autonomic Pharmacology, and Clinical Pharmacology. The second group of chapters discusses the processes of drug discovery and the safety requirements for drugs to be used therapeutically and include Drug Discovery and Safety, Pharmacology assessment. The largest group of chapters discusses different therapeutic areas and include Cardiovascular and renal pharmacology, Endocrine pharmacology, Neuropsychopharmacology, Pulmonary Pharmacology, Gastrointestinal pharmacology, Poisons, venoms, and toxins, Drugs on skeletal muscle, the Pharmacotherapy of inflammation, Reproductive pharmacology, Pain pharmacology, and analgesia. The final group of chapters discusses new approaches and include Pharmacogenetics and pharmacogenomics, Immunopharmacology, and Gene therapy. These two volumes are aimed at the following: a wide spectrum of audiences from the merely curious to those seeking in-depth knowledge. University and College students, Educators, Professional practitioners, Research personnel, and Policy analysts, managers, and decision makers, and NGOs.

New Natural Products and Plant Drugs with Pharmacological, Biological or Therapeutical Activity

H.K. Wagner, P.M. Wolff, 2012-12-06. The fact that of the approximately 600 000 plant species existing on the earth only some 5 % have been specifically investigated chemically or pharmacologically is a challenge to chemists specializing in natural substances and to pharmacologists. In view of the limited number of research capacities and the ever diminishing financial means, this challenge can only be met if together with an improvement and refinement of methods of analysis, medicinal plant research is carried out on a broader interdisciplinary basis with comparable scientifically recognized screening methods and if it is better coordinated with greater use of modern documentation means. It is thus necessary in the future to concentrate specifically on projects leading to the development of new medicinal preparations. The plenary lectures held in the present symposium of the 1st International Congress for Research on Medicinal Plants reflect these efforts and tendencies. At the same time they provide a survey of some of the fields of medicinal plant research which are at present most actual and most intensively researched. They range from plant screening, isolation, and structure elucidation of new principles to the therapeutical optimization of a natural product. The lectures given at this congress show clearly the necessity in addition to national phytochemical societies for a central international organisation in which all active medicinal plant researchers in the world are included. Their aim should be to provide the impulse for more optimal rational research aimed at the solution of specific projects.

Drug Discovery and Evaluation: Safety and Pharmacokinetic Assays

Franz J. Hock, Michael K.

Pugsley, 2024-10-21 Many aspects of drug safety have become an outstanding and even persistent issue and may occur during the process of both drug discovery and development Until 15 years ago drug discovery and evaluation was primarily a sequential process starting with the selection of the most pharmacologically active compound from a series of newly synthesized small molecule chemical series by means of distinctive pharmacological assays Safety aspects were addressed by evaluation of the selected compound at high doses in a series of specific studies directed at indications other than the intended indication of the new compound These tests are then followed by pharmacokinetic studies which are primarily conducted to confirm whether the selected compound possesses a suitable half life for sufficient exposure and efficacy and whether it has the desired properties specificity to the intended route of administration Safety aspects relied predominantly on the conduct of single and repeat toxicology dose studies which inform changes in organ structure rather than organ function Both toxicological and pharmacokinetic studies are adapted to the progress of studies in clinical pharmacology and clinical trials The new edition of this well and broadly accepted reference work contains several innovative and distinguished chapters This sequential strategy has been abandoned with this new version of the book for several reasons Of the possible multitude of negative effects that novel drugs may impart on organ function e g ventricular tachy arrhythmia many are detected too late in non clinical studies to inform clinicians On the other hand negative findings in chronic toxicity studies in animals may turn out to be irrelevant for human beings New scientific approaches e g high throughput screening human pluripotent stem cells transgenic animals knock out animals in silico models pharmaco genomics and pharmaco proteomics as well as Artificial Intelligence AI methods offered new possibilities There are several examples that show that the druggability of compounds was considerably underestimated when the probability of success of a new project was assessed The success rate in the pharmaceutical industry and the introduction of new chemical entities to the market per year dropped dramatically whereas the development time for a new compound increased sometimes exceeding the patent protection Research and development scientists involving the following changes therefore adopted a change of strategy Parallel instead of sequential involvement of the various disciplines multidimensional compound optimization The term Safety Pharmacology was coined The International Conference on Harmonization ICH founded a Safety Pharmacology Working Group and the Safety Pharmacology Society SPS was launched The discipline provided for evaluation development and validation of a multitude of safety tests outlined in the Core Battery of Studies Characterizing the exposure profile of a drug by conducting pharmacokinetic studies that evaluates the absorption distribution metabolism and excretion should to be investigated at an early stage of development as results contribute to the selection of a compound for further development Advancements in Toxicology were achieved by the introduction of new methods e g in silico methods genetic toxicology computational toxicology and AI The book is a landmark in the continuously changing world of drug research and developments As such it is essential reading for many groups not only for all students of pharmacology and toxicology but

also for industry scientists and physicians especially those involved in clinical trials of drugs and for pharmacists who must know the safety requirements of drugs The book is essential for scientists and managers in the pharmaceutical industry who are involved in drug discovery drug development and decision making in the development process In particular the book will be of use to government institutions and committees working on official guidelines for drug evaluation worldwide
