- **Radio galaxies** are usually elliptical and exhibit a jet structure from compact nuclei.
  - Generally exhibit two lobes of radio frequency emission which may extend for millions of light years
  - Usually the lobes are symmetrically located on opposite sides of the galaxy
  - Some of the energy comes from the visible body of the galaxy and tiny nuclear region, less than a light year across

## Radio Galaxies:

Radio Galaxies A. G. Pacholczyk, 2014-06-20 Radio Galaxies Radiation Transfer Dynamics Stability and Evolution of a Synchrotron Plasmon deals with the physics of a region in space containing magnetic field and thermal and relativistic particles a plasmon The synchrotron emission and absorption of this region are discussed along with the properties of its spectrum its linear and circular polarization transfer of radiation through such a region its dynamics and expansion and interaction with external medium Comprised of eight chapters this volume explores the stability turbulence and acceleration of particles in a synchrotron plasmon as well as its application to the physics of radio galaxies The discussion begins with a description of extragalactic radio sources and their properties followed by an analysis of the emission and absorption of synchrotron radiation Subsequent chapters focus on the transfer of polarized radiation in a magnetoactive plasma hydromagnetics and hydromagnetic stability confinement and structure of extended radio sources and radio tail galaxies The book also considers compact radio sources before concluding with an evaluation of radio source theories This monograph is addressed primarily to radio astronomers and graduate students working on the interpretation of observational data

*Radio Galaxies at TeV Energies* Dorit Glawion, 2020-05-13 It is common believe that the centers of all galaxies exhibit supermassive black holes with masses ranging from millions up to billions of the mass of our Sun By accreting surrounding matter the luminosity of these galactic nuclei can outshine the emission of their host galaxies If this is the case they are called active galactic nuclei Some of these objects eject powerful outflows composed of plasma called jets These jets can produce non thermal radiation which observable across the entire electromagnetic spectrum from radio up to the gamma ray frequencies At highest frequencies TeV range most of the detected active galaxies have jets directed along or close to the line of sight However also galaxies with larger angles to the line of sight showing fascinating features were discovered in seeming contradiction to traditional models for these so called radio galaxies Thus the latter are of particular importance for understanding active galactic nuclei in general This Special Issue contains reviews and research articles about the current knowledge of radio galaxies at TeV energies including observational results and theoretical models It is intended to guide the interested reader deeper into this fascinating discipline of modern day astronomy **Literature 1980, Part 2** Siegfried
