Rathe, Paul Elliott, 1982 *Adaptive Motion Compensation in Radiotherapy* Martin J. Murphy, 2011-12-14 External beam radiotherapy has long been challenged by the simple fact that patients can and do move during the delivery of radiation Recent advances in imaging and beam delivery technologies have made the solution adapting delivery to natural movement a practical reality Adaptive Motion Compensation in Radiotherapy provides the first detailed treatment of online interventional techniques for motion compensation radiotherapy This authoritative book discusses Each of the contributing elements of a motion adaptive system including target detection and tracking beam adaptation and patient realignment Treatment planning issues that arise when the patient and internal target are mobile Integrated motion adaptive systems in clinical use or at advanced stages of development System control functions essential to any therapy device operating in a near autonomous manner with limited human interaction Necessary motion detection methodology repositioning techniques and approaches to interpreting and responding to target movement data in real time Medical therapy with external beams of radiation began as a two dimensional technology in a three dimensional world However in all but a limited number of scenarios movement introduces the fourth dimension of time to the treatment problem Motion adaptive radiation therapy represents a truly four dimensional solution to an inherently four dimensional problem From these chapters readers will gain not only an understanding of the technical aspects and capabilities of motion adaptation but also practical clinical insights into planning and carrying out various types of motion adaptive radiotherapy treatment **Washington and Leaver's Principles and Practice of Radiation Therapy - E-BOOK** Charles M. Radiologic Management of Musculoskeletal Tumors Holger Pettersson,Dempsey S. Springfield,William F. Enneking,2012-12-06 During the last decade the therapeutic approach to musculoskeletal tumors has changed dramatically from ablative surgery with amputation of the limb to reconstructive surgery with transplantation of bone and vessels combined with radio and chemotherapy This has changed the demands on radiologists and pathologists to a considerable degree At the same time there has been a manifold increase in the diagnostic possibilities offered by modern radiology with several new modalities affording a potential for morphologic depiction and tissue characterization that was unattainable a decade ago Today the definitive diagnostic work up and treatment of patients with musculoskeletal tumors is most often done in tumor centers by groups that ideally should be composed of an orthopedic surgeon radiotherapist oncologist radiologist pathologist and cytologist It is necessary for all the members of this team to be well versed in the surgical and other treatment principles in the pathologic concepts and in the radiologic interpretation of musculoskeletal tumors Moreover it is important that the modern diagnostic approach to musculoskeletal tumors is well known also at the referring center be it a private practitioner's office or a large hospital This will avoid unnecessary biopsies and repetition of radiologic and other diagnostic procedures that have already been performed at the referring center
