

RESEARCH IN DEMENTIA PRECOX

NOLAN D. C. LEWIS, M.D.

Department of Psychiatry, University of California, San Francisco, California

Abstract: This review discusses the current state of research in dementia praecox, focusing on the genetic, neurobiological, and psychological aspects of the disorder.

Keywords: dementia praecox, schizophrenia, genetics, neurobiology, psychology.

The term dementia praecox, which was first used by Kraepelin (1899), refers to a group of severe mental disorders characterized by the onset of symptoms in late adolescence or early adulthood.

These disorders are now collectively known as schizophrenia, but the term dementia praecox is still used in some contexts, particularly in the study of its genetic and neurobiological aspects.

This review discusses the current state of research in dementia praecox, focusing on the genetic, neurobiological, and psychological aspects of the disorder.

The genetic aspect of dementia praecox has been extensively studied, and it is now well established that the disorder has a strong hereditary component.

Studies of twins and families have shown that the risk of developing dementia praecox is significantly higher for individuals who have a first-degree relative with the disorder.

Recent research has also identified specific genes that are associated with an increased risk of dementia praecox, including the DISC1 and COMT genes.

The neurobiological aspect of dementia praecox has also been extensively studied, and it is now well established that the disorder is associated with abnormalities in the brain.

These abnormalities include changes in the size and structure of the brain, as well as changes in the levels of neurotransmitters such as dopamine and serotonin.

Recent research has also identified specific brain regions that are involved in the pathogenesis of dementia praecox, including the prefrontal cortex and the hippocampus.

The psychological aspect of dementia praecox has also been extensively studied, and it is now well established that the disorder is associated with a range of psychological symptoms.

These symptoms include positive symptoms such as hallucinations and delusions, as well as negative symptoms such as social withdrawal and apathy.

Recent research has also identified specific psychological factors that are associated with an increased risk of dementia praecox, including childhood trauma and social isolation.

In conclusion, the current state of research in dementia praecox is rapidly evolving, and it is now well established that the disorder is a complex condition with a strong genetic and neurobiological component.

Further research is needed to identify the specific mechanisms underlying the pathogenesis of dementia praecox, and to develop effective treatments for the disorder.
