Male infertility accounts for 30% of infertility cases and its prevalence in the general population approximately ranges between 9 and 15%, according to the available surveys [1]. Male infertility is emerging as an important cause of infertility worldwide; the growing scientific interest in this field of reproductive medicine is demonstrated by the increasing number of scientific papers published by journals dedicated to andrology, urology, and reproductive medicine. Since 2020, the *Journal of Clinical Medicine* has dedicated a novel section to Reproductive Medicine and Andrology, with 136 articles being published to date. This editorial aims to highlight the most prominent contributions to the field of male infertility provided by this section of the journal.

Recent research has improved our understanding of the sperm contribution to fertilization and embryo development, which goes well beyond the simple provision of the paternal haploid genome to the oocyte. Chiocciarelli and coworkers provided an in-dept review of the contribution of histone post-translational modifications (PTMs) to key spermatogenic events, such as the self-renewal and commitment of spermatogonia, meiotic recombination, chromatin remodeling, as well as of their role in sperm function and embryo development. Since many histone PTMs remain associated with the paternal genome during de novo chromatin formation occurring after fertilization, the authors provide some intriguing hypotheses to explain how sperm histones may play a key role for a proper embryonic reprogramming and transgenerational epigenetic inheritance. The authors also reviewed the available evidence on the impact of circular RNAs (circRNAs) on sperm quality and embryo development [2].

Azoospermia due to spermatogenic dysfunction, also termed non-obstructive azoospermia (NOA), is the most severe form of male infertility, affecting about 1% of the male population and 10–15% of the infertile men. A Special Issue in this journal ([mdpi.com/journal/jcm/special\\_issues/NOA\\_Management](https://www.mdpi.com/journal/jcm/special_issues/NOA_Management)) was dedicated to this argument. As more extensively detailed in the accompanying editorial [3], the Special Issue was built on the contributions of opinion leaders such as Peter N. Schlegel and his group, who illustrated how to manage patients with NOA and optimize the success of mTESE [4], as well as the reproductive chances of men with NOA according to the underlying etiologies [5]; Sandro Esteves and coworkers, who provided a detailed explanation on how to discriminate the two forms of azoospermia, obstructive vs. non-obstructive [6]; Krausz and Cioppi, who reviewed the most common genetic abnormalities in men with NOA and their possible impact on their general and reproductive health, as well as on their offspring health [7]; Goulis and colleagues, who showed how the eventual post-surgical hypogonadism may depend upon some clinical factors, including etiology of NOA, the number of previous surgical attempts, and testicular volume [8]; Aydos, who provided an in-depth review of the available procedures to select testicular sperm for ICSI [9]; Smith, who explored the possible application of microfluidic technology to isolation of sperm from testicular samples [10]; and our group, who proposed a detailed description of the microTESE surgical technique [11], reviewed
