Materials Science and Engineering. Volume I Abbas Hamrang, 2016-04-19 This volume highlights the latest developments and trends in advanced non classical materials and structures It presents the developments of advanced materials and respective tools to characterize and predict the material properties and behavior It also includes original theoretical and important experimental results that use non routine method *Foundations of Nanotechnology, Volume Two* Sabu Thomas, Saeedeh Rafiei, Shima Maghsoodlou, Arezo Afzali, 2014-10-24 The collection of topics in this book reflects the diversity of recent advances in nanoelements formation and interactions in nanosystems with a broad perspective that is useful for scientists as well as for graduate students and engineers One of the main tasks in making nanocomposites is building the dependence of the structure and shape of the nanoelements forming the basis for the composite of their sizes This is because with an increase or a decrease in the specific size of nanoelements their physical mechanical properties such as the coefficient of elasticity strength and deformation parameter vary by over one order The calculations show that this is primarily due to a significant rearrangement of the atomic structure and the shape of the nanoelement The investigation of the above parameters of the nanoelements is technically complicated and laborious because of their small sizes When the characteristics of powder nanocomposites are calculated it is also very important to take into account the interaction of the nanoelements since the changes in their original shapes and sizes in the interaction process and during the formation of the

nanocomposite can lead to a significant change in its properties and a cardinal structural rearrangement. In addition, the studies show the appearance of the processes of the ordering and self assembling leading to a more organized form of a nanosystem. The above phenomena play an important role in nanotechnological processes. They allow nanotechnologies to be developed for the formation of nanostructures by the self assembling method which is based on self organizing processes and building up complex spatial nanostructures consisting of different nanoelements. The study of the above dependences based on the mathematical modeling methods requires the solution of the aforementioned problem at the atomic level. This requires large computational aids and computational time which makes the development of economical calculation methods urgent. The objective of this volume is the development of such a technique in various nanosystems. Materials Science and Engineering Abbas Hamrang, Gennady E. Zaikov, A. K. Haghi, E. Klodzinska, 2018-10-03. This book has an important role in advancing non classical materials on the macro and nanoscale. The book provides original theoretical and important experimental results. term smart ceramics refers to ceramic materials fabricated from ultrafine particles. They have attracted the attention of researchers and scientists thanks to their potential to manipulate the length scale in the nanorange leading to better and some unusual material properties. Smart ceramics ensure control of particle size, surface contamination and degree of agglomeration. They play a crucial role in challenging applications such as bone surgery e.g. the development of substitutes for load bearing bone parts and in biomedical science especially in tissue engineering, dental applications and drug and antigen delivery using modified ceramics. Porous nanostructured ceramics have potential use in both simple and complex applications such as bioimaging, sensors, paints and pigments, optics and electronics because of their surface and size dependent properties. For the synthesis of smart ceramics the sol gel route has been mainly utilized because of its ability to produce a large variety of compositions and to ensure homogeneous mixing of the constituent particles at low temperature. This book describes the innovations in technologies through the development of functionalized ceramic materials for various applications. It also describes recent and expected challenges along with their potential solutions in advanced techniques for the synthesis and characterization of nanostructured ceramics and their composites: bioceramics, bioactive ceramics, multifunctional nanoceramics, transparent ceramics, nanocore shells, nanowires, thin films, nanotubes and nanorods. The applications include the environment, health care, electrochemical sensors, high temperature superconductors, nuclear reactor fuels, electrical insulators, refractory materials, electrical transformers and magnetic core memory. The book will benefit researchers, scientists, engineers and technologists working in the industry and in national and international research laboratories, academics who are interested in traditional and advanced smart ceramic composites and students pursuing their postgraduate, graduate and undergraduate degrees in smart ceramics, nanomaterials, nanoscience and engineering.
