Polymer Characterisation B.J. Hunt, M.I. James, 2012-12-06 Polymers continue to play an ever increasing role in the modern world In fact it is quite inconceivable to most people that we could ever have existed of the increased volume and variety of materials without them As a result currently available and the diversity of their application characterisation has become an essential requirement of industrial and academic laboratories involved with polymeric materials On the one hand requirements may come from polymer specialists involved in the design and synthesis of new materials who require a detailed understanding of the relationship between the precise molecular architecture and the properties of the polymer in order to improve its capabilities and range of applications On the other hand many analysts who are not polymer specialists are faced with the problems of analysing and testing a wide range of polymeric materials for quality control or material specification purposes We hope this book will be a useful reference for all scientists and techno or industrial laboratories logists involved with

polymers whether in academic and irrespective of their scientific discipline We have attempted to include in one volume all of the most important techniques Obviously it is not possible to do this in any great depth but we have encouraged the use of specific examples to illustrate the range of possibilities In addition numerous references are given to more detailed texts on specific subjects to direct the reader where appropriate The book is divided into II chapters

spectroscopists seeking a one stop resource for polymer characterization using spectroscopic analyses *Thermal Analysis of Polymeric Materials* Bernhard Wunderlich, 2005-12-06 Thermal analysis is an old technique It has been neglected to some degree because developments of convenient methods of measurement have been slow and teaching of the understanding of the basics of thermal analysis is often wanting Flexible linear macromolecules also not as accurately simply called polymers make up the final third class of molecules which only was identified in 1920 Polymers have never been fully integrated into the disciplines of science and engineering This book is designed to teach thermal analysis and the understanding of all materials flexible macromolecules as well as those of the small molecules and rigid macromolecules The macroscopic tool of inquiry is thermal analysis and the results are linked to microscopic molecular structure and motion Measurements of heat and mass are the two roots of quantitative science The macroscopic heat is connected to the microscopic atomic motion while the macroscopic mass is linked to the microscopic atomic structure The macroscopic units of measurement of heat and mass are the joule and the gram chosen to be easily discernable by the human senses The microscopic units of motion and structure are 10^{-12} the picosecond 10^{-10} seconds and the nanogram 10^{-9} meters chosen to fit the atomic scales One notes a factor of 10 000 between the two atomic units when expressed in human units second and gram with one gram being equal to one cubic centimeter when considering water Perhaps this is the reason for the much better understanding and greater interest in the structure of materials being closer to human experience when compared to molecular motion
