Radiation Sources:

Radiation Source Use and Replacement National Research Council, Division on Earth and Life Studies, Nuclear and Radiation Studies Board, Committee on Radiation Source Use and Replacement, 2008-05-25 In the United States there are several thousand devices containing high activity radiation sources licensed for use in areas ranging from medical uses such as cancer therapy to safety uses such as testing of structures and industrial equipment Those radiation sources are licensed by the U S Nuclear Regulatory Commission and state agencies Concerns have been raised about the safety and security of the radiation sources particularly amid fears that they could be used to create dirty bombs or radiological dispersal device RDD In response to a request from Congress the U S Nuclear Regulatory Commission asked the National Research Council to conduct a study to review the uses of high risk radiation sources and the feasibility of replacing them with lower risk alternatives The study concludes that the U S government should consider factors such as potential economic consequences of misuse of the radiation sources into its assessments of risk Although the committee found that replacements of most sources are possible it is not economically feasible in some cases The committee recommends that the U S government take steps to in the near term to replace radioactive cesium chloride radiation sources a potential dirty bomb ingredient used in some medical and research equipment with lower risk alternatives The committee further recommends that longer term efforts be undertaken to replace other sources The book presents a number of options for making those replacements

Radiation Safety in the Use of Radiation Sources in Research and Education IAEA, 2024-02-09 Radiation sources used in research and education include particle accelerators sealed radioactive sources such as low activity check sources and high activity sealed radioactive sources in irradiators unsealed radioactive sources that are used as tracers in field work and in laboratory work naturally occurring radioactive material and X ray generators such as diffraction apparatus and fluorescence analyzers This Safety Guide provides recommendations on how to meet the relevant requirements of IAEA Safety Standards Series No GSR Part 3 in the use of radiation sources in research and education It provides guidance on the control of occupational exposure and of public exposure for planned exposure situations and where appropriate emergency exposure situations and on the safety measures specific to this practice The recommendations in this publication are aimed primarily at operating organizations such as educational and research establishments including schools colleges universities and technical institutes that are authorized to use radiation sources in academic programs as well as their employees students teachers and radiation protection officers The guidance will also be of interest to individuals working for regulatory bodies and other relevant organizations involved in design manufacture supply and service of radiation sources and associated equipment for research and education

Medical Management of Radiation Accidents Kenneth S. Countering Nuclear and Radiological Terrorism Samuel Apikyan,David Diamond,2007-05-22 In recognition that no single country possesses all the answers to the critical scientific institutional and legal questions associated with combating nuclear and radiological terrorism the 2005 Workshop and these proceedings were structured to promote wide ranging multi national exploration of critical technology needs and underlying scientific challenges to reducing the threat of nuclear radiological terrorism to illustrate through country specific presentations how resulting technologies were used in national programs and to outline the role of legal policy and institutional frameworks in countering nuclear radiological terrorism One key outcome of this book is a better understanding of the independent contributions from across the international community of the scientific and technological components and the legal policy and institutional components to combating nuclear radiological terrorism The book can serve as a tool for communicating the outcomes of the workshop to the multi national scientific communities engaged in combating nuclear radiological terrorism and to those working at governmental and policy levels

Nuclear Power and Energy Security Samuel Apikyan,David Diamond,2009-10-19 The basic logic is very simple Countries around the globe have a need for more electrical generating capacity because of increases in population and increases in energy use per capita The needs are constrained by the requirement that the base load energy source be economical secure and not emit climate changing gases Nuclear power fits this description Therefore many countries that have not had a nuclear power program or only had a small program see a need to develop one in the future However the development of a national nuclear energy program is not so simple The purpose of the NATO Advanced Research Workshop on Nuclear Power and Energy Security was to contribute to our understanding of how these programs might evolve The workshop took place 26-29 May 2009 in Yerevan Armenia Approximately 50 participants discussed the infrastructure that is needed and some of the reactor options that might be considered The papers in this book helped define the discussion that took place The infrastructure that is needed includes a legal framework a functioning regulator a plan for waste disposal a plan for emergency response etc These needs were explained and just as importantly it was explained what international bilateral and regional cooperation is available Although there were many countries represented the Armenian experience was of particular interest because of where the meeting was located The papers on reactor options covered both innovative and evolutionary designs
