Optical Sensor Systems in Biotechnology Govind Rao, 2009-11-02 Of all things natural light is the most sublime From the very existential belief of the origins of the universe to its role in the evolution of life on earth light has been inextricably woven into every aspect of our lives I am grateful to Springer Verlag and Thomas Scheper for this invitation to organize this volume that continues to expand the use of light to create next generation sensing applications Indeed the very act of expanding the frontiers of learning and knowledge are referred to in many languages and cultures as enlightenment Early optical instruments relied largely on simple combinations of mirrors prisms and lenses With these simple devices substantial progress was made in our understanding of the properties of light and of its interactions with matter Things got more complicated with the evolution of optical instruments in laboratory use Early systems used bulky and expensive hardware to generate light split it into the desired wavelengths and finally collect it for analysis The discovery of the laser pushed the technology further but did not do much to make its adoption more widespread as the lasers themselves were large and required substantial electrical power to operate The true revolution is just beginning Advances in microelectronics have resulted in the possibility of truly low cost using the consumer electronics industry as a parallel devices that exploit optical

*Plasmonic Control of Light Emission* Young Chul Jun, 2010 Enhanced light-matter interactions in light-confining structures such as optical cavities have been extensively investigated for both fundamental studies and practical applications Plasmonic nanostructures which can confine and manipulate light down to 1 nm scale are becoming increasingly important Many areas of optical physics and devices can benefit from such extreme light concentration and manipulation For example fluorescent molecule or quantum dot (QD) emission can be strongly modified and controlled via surface plasmon polariton (SPP) coupling In this dissertation we present our theoretical and experimental studies on QD emission in metal nanogap structures that can provide extreme field concentration enhancing light-matter interactions significantly We start with a theoretical analysis of dipole emission in metal dielectric metal (MDM) waveguide structures We look at both infinite *i.e.* planar and finite thickness MDM structures We find that both structures exhibit strong spontaneous emission enhancements due to the tight confinement of modes between two metallic plates and that light emission is dominated by gap SPP coupling For planar structures we present analytical solutions for the enhanced dipole decay rate while for finite thickness MDM structures *i.e.* nanoslits we present results from numerical simulations Next we present our experiments on the SPP coupling of CdSe/ZnS QD emission in metal nanoslits First we observed clear lifetime and polarization state changes of QD emission with slit width due to gap SPP excitation Second with optimized side grooves *i*

e combined slit groove and hole groove structures we collimated QD emission vertically into a very narrow angle achieving an unprecedented level of directionality control and visualized it with confocal scanning microscopy Third by using two metal plates as electrodes we dynamically modulated the QD emission intensity and wavelength with external voltage Finally we extend our dipole emission calculation to several slot waveguide structures We consider light emission in metal slots metal oxide Si slots and Si slot waveguides We find that large spontaneous emission enhancements can be obtained over a broad range of wavelengths and that light emission is strongly funneled into slot waveguide modes These represent broadband waveguide QED quantum electro dynamics systems which have unique merits for on chip light sources and quantum information processing These theoretical and experimental studies show that the SPP coupling of light emission is a very promising way to control light emission properties and may find broad application in spectroscopy sensing optoelectronics and integrated optics
