Reports On Progress In Physics Volume 21:

Scattering of Thermal Neutrons Andre Larose, 2012-12-06 Solid state physicists have long appreciated the usefulness of thermal neutron scattering in the investigation of condensed matter This technique was first made possible by the advent of the nuclear reactor and has since then undergone many refinements The developments in this field of research have we felt necessitated the making of a comprehensive compilation of the published thermal neutron papers The large number of titles collected in this book as well as their diversity and their yearly distribution reflects the continued contribution of the neutron probe to our understanding of physical systems This bibliography is an updated and improved version of the one first published by us in March of 1973 under a similar title Many of the omissions and inconsistencies of the first edition such as occurred for example in the initialing of authors names have been corrected The literature search has been carried back to 1932 the year when the existence of the neutron was experimentally confirmed Several additional journals have also been searched and brought up to date together with those listed in our first publication The number of entries is now 8543 an increase of 65 per cent relative to the first edition

the domains of photonic device physics and neural networks providing a comprehensive overview of the emerging field of neuromorphic photonics It includes a thorough discussion of evolution of neuromorphic photonics from the advent of fiber optic neurons to today's state of the art integrated laser neurons which are a current focus of international research Neuromorphic Photonics explores candidate interconnection architectures and devices for integrated neuromorphic networks along with key functionality such as learning It is written at a level accessible to graduate students while also intending to serve as a comprehensive reference for experts in the field Fifty Years of Progress in Metallographic

presents five review articles by well known experts on topics of current interest in optics The first article concerns quantum fluctuations a phenomenon encountered directly or indirectly in all optical measurements Such fluctuations set limits to attainable accuracy with which measurements can be made In recent years theoretical as well as experimental research has demonstrated that limitations arising from quantum fluctuations can sometimes be circumvented to some extent These developments are of importance from the standpoint of basic physics as well as in connection with technological applications such as noise reduction in communication systems The second article deals with correlation holographic interferometry and speckle photography paying special attention to the effects of random variation of surface microstructure on the contrast of interference fringes The article which follows covers an important subject in the broad area of wave propagation in random media namely wave localization This phenomenon is a subtle manifestation of interference of multiply scattered waves and provides information about important properties of disordered systems The article considers mainly localization in one dimensional systems which elucidate some of the underlying physics The fourth article discusses an important nonlinear phenomenon namely soliton propagation in fibres Solitons are pulses which can propagate over long distances without change in shape Because of their considerable stability they are of particular interest for communication systems The concluding article presents the theory and describes experiments on elementary quantum systems in the context of cavity quantum optics Such experiments are providing deeper understanding of the interaction of light with matter and give new insights into the foundations of quantum mechanics
