Materials Science and Technology E. J. Kramer, 2005-08-19 Nondestructive Characterization of Materials XI Robert E. Green, B. Boro Djordjevic, Manfred P. Hentschel, 2019-06-12 The papers published in these proceedings represent the latest developments in the nondestructive characterization of materials and were presented at the Eleventh International Symposium on Nondestructive Characterization of Materials held in June 24-28 2002 in Berlin Germany **Materials Characterization for Process Control and Product Conformity** Klaus Goebbels, 1994-09-20 Nondestructive testing (NDT) is used to examine the ability of materials and components to withstand loads. Two features of NDT are defect inspection and materials characterization. Because of the increasing ability to manufacture materials and products defect free, there is less need for defect oriented NDT but an increasing need for materials characterization. This book is the first comprehensive work on materials characterization presenting the state of the art and practical applications. Materials characterization is used during production operations, service intervals or after repairs. Materials are used to withstand mechanical, thermal, chemical and irradiation loads or a combination thereof. The ability to withstand these loads is essentially a function of parameters like chemical composition, microstructure, macrostructure, residual stresses and materials properties. The physical background of NDT is presented along with its different methods. Ultrasonics, electromagnetics and X rays are treated with appropriate detail while other methods such as acoustic emission, vibration analysis, optical and thermal methods are also covered. The different methods of materials characterization are discussed following the goal parameters from atomic to macroscopic dimensions. One of the practical features of the book is the presentation of real world applications. On line process control and condition monitoring are discussed as well as off line applications for materials characterization after production and after operation. *Materials Science and Technology* Sabar Hutagalung, 2012-03-07 Materials are important to mankind because of the benefits that can be derived from the manipulation of their properties for example electrical conductivity, dielectric constant, magnetization, optical transmittance, strength and toughness. Materials science is a broad field and can be considered to be an interdisciplinary area. Included within it are the studies of the structure and properties of any material, the creation of new types of materials and the manipulation of a material's properties to suit the needs of a specific application. The contributors of the chapters in this book have various areas of expertise; therefore, this book is interdisciplinary and is written for readers with backgrounds in physical science. The book consists of fourteen chapters that have been divided into four sections. Section one includes five chapters on advanced materials and processing. Section two includes two chapters on biomaterials which deal with the preparation and modification of new types of biomaterials. Section three consists of three chapters on nanomaterials, specifically the study of carbon nanotubes, nanomachining and nanoparticles. Section four includes four chapters on optical materials. **Materials Science and Technology : a Comprehensive Treatment** Robert W. Cahn, Peter Haasen, Edward J.
