*Modern Methods in Scientific Computing and Applications* Anne Bourlioux, Martin Gander, 2012-12-06 When we first heard in the spring of 2000 that the Séminaire de mathématiques supérieures SMS was interested in devoting its session of the summer of 2001 its 40th to scientific computing the idea of taking on the organizational work seemed to us somewhat remote More immediate things were on our minds one of us was about to go on leave to the Courant Institute the other preparing for a research summer in Paris But the more we learned about the possibilities of such a seminar the support for the organization and also the great history of the SMS the more we grew attached to the project The topics we planned to cover were intended to span a wide range of theoretical and practical tools for solving problems in image processing thin films mathematical finance electrical engineering moving interfaces and combustion These applications alone show how wide the influence of scientific computing has become over the last two decades almost any area of science and engineering is greatly influenced by simulations and the SMS workshop in this field came very timely We decided to organize the workshop in pairs of speakers for each of the eight topics we had chosen and we invited the leading experts worldwide in these fields We were very fortunate that every speaker we invited accepted to come so the program could be realized as planned

**Computing Qualitatively Correct Approximations of Balance Laws** Laurent Gosse, 2013-03-30 Substantial effort has

been drawn for years onto the development of possibly high order numerical techniques for the scalar homogeneous conservation law an equation which is strongly dissipative in L1 thanks to shock wave formation Such a dissipation property is generally lost when considering hyperbolic systems of conservation laws or simply inhomogeneous scalar balance laws involving accretive or space dependent source terms because of complex wave interactions An overall weaker dissipation can reveal intrinsic numerical weaknesses through specific nonlinear mechanisms Hugoniot curves being deformed by local averaging steps in Godunov type schemes low order errors propagating along expanding characteristics after having hit a discontinuity exponential amplification of truncation errors in the presence of accretive source terms This book aims at presenting rigorous derivations of different sometimes called well balanced numerical schemes which succeed in reconciling high accuracy with a stronger robustness even in the aforementioned accretive contexts It is divided into two parts one dealing with hyperbolic systems of balance laws such as arising from quasi one dimensional nozzle flow computations multiphase WKB approximation of linear Schrödinger equations or gravitational Navier Stokes systems Stability results for viscosity solutions of onedimensional balance laws are sketched The other being entirely devoted to the treatment of weakly nonlinear kinetic equations in the discrete ordinate approximation such as the ones of radiative transfer chemotaxis dynamics semiconductor conduction spray dynamics or linearized Boltzmann models Caseology is one of the main techniques used in these derivations Lagrangian techniques for filtration equations are evoked too Two dimensional methods are studied in the context of non degenerate semiconductor models
