Numerical Methods Of Mathematical Optimization With Algol And Fortran Programs:

Numerical Methods of Mathematical Optimization Hans P. Künzi, H. G. Tzschach, C. A. Zehnder, 2014-05-12

Numerical Methods of Mathematical Optimization With ALGOL and FORTRAN Programs reviews the theory and the practical application of the numerical methods of mathematical optimization. An ALGOL and a FORTRAN program was developed for each one of the algorithms described in the theoretical section. This should result in easy access to the application of the different optimization methods. Comprised of four chapters, this volume begins with a discussion on the theory of linear and nonlinear optimization with the main stress on an easily understood mathematically precise presentation. In addition to the theoretical considerations, several algorithms of importance to the numerical application of optimization theory are described. The next chapter explains the computer programs used in actual optimization which have the form of procedures or subroutines. The book concludes with an analysis of ALGOL and FORTRAN, paying particular attention to their use in global optimization procedures as well as for the simplex and duoplex methods and the decomposition Gomory, Beale and Wolfe algorithms. This monograph will be helpful to students and practitioners of computer science and applied mathematics.

Introduction to Optimization

Methods P. Aaby, 2013-03-09 During the last decade the techniques of non linear optimization have emerged as an

important subject for study and research. The increasingly widespread application of optimization has been stimulated by the availability of digital computers and the necessity of using them in the investigation of large systems. This book is an introduction to non linear methods of optimization and is suitable for undergraduate and post graduate courses in mathematics, the physical and social sciences and engineering. The first half of the book covers the basic optimization techniques including linear search, methods of steepest descent, least squares and the Newton-Raphson method. These are described in detail with worked numerical examples since they form the basis from which advanced methods are derived. Since 1965 advanced methods of unconstrained and constrained optimization have been developed to utilise the computational power of the digital computer. The second half of the book describes fully important algorithms in current use such as variable metric methods for unconstrained problems and penalty function methods for constrained problems. Recent

work much of which has not yet been widely applied is reviewed and compared with currently popular techniques under a few generic main headings vi PREFACE Chapter I describes the optimization problem in mathematical form and defines the terminology used in the remainder of the book Chapter 2 is concerned with single variable optimization The main algorithms of both search and approximation methods are developed in detail since they are an essential part of many multi variable methods

Numerical Methods of Mathematical Optimization: Numerische Methoden Der Mathematischen Optimierung Hans Paul Künzi, H. G. Tzschach, C. A. Zehnder, 1966 *Optimization Problems* L. Collatz, W.

Wetterling, 2012-12-06 The German edition of this book first published in 1966 has been quite popular we did not however consider publishing an English edition because a number of excellent textbooks in this field already exist In recent years however the wish was frequently expressed that especially the description of the relationships between optimization and other subfields of mathematics which is not to be found in this form in other texts might be made available to a wider readership so it was with this in mind that belatedly a translation was undertaken after all Since the appearance of the German edition the field of optimization has continued to develop at an unabated rate A completely current presentation would have required a total reworking of the book unfortunately this was not possible For example we had to ignore the extensive progress which has been made in the development of numerical methods which do not require convexity assumptions to find local maxima and minima of non linear optimization problems These methods are also applicable to boundary value and other problems Many new results both of a numerical and a theoretical nature which are especially relevant to applications are to be found in the areas of optimal control and integer optimization

Lectures on Numerical Mathematics H.

Rutishauser, 2012-12-06 The present book is an edition of the manuscripts to the courses Numerical Methods I and Numerical Mathematics I and II which Professor H Rutishauser held at the ETH in Zurich The first named course was newly conceived in the spring semester of 1970 and intended for beginners while the two others were given repeatedly as elective courses in the sixties For an understanding of most chapters the fundamentals of linear algebra and calculus suffice In some places a little complex variable theory is used in addition However the reader can get by without any knowledge of functional analysis The first seven chapters discuss the direct solution of systems of linear equations the solution of nonlinear systems least squares problems interpolation by polynomials numerical quadrature and approximation by Chebyshev series and by Remez algorithm The remaining chapters include the treatment of ordinary and partial differential equations the iterative solution of linear equations and a discussion of eigen value problems In addition there is an appendix dealing with the qd algorithm and with an axiomatic treatment of computer arithmetic
