Geriatric Oncology Arti Hurria,Lodovico Balducci,2009-07-14 Cancer and aging are integrally related Cancer incidence and mortality increase with age with most

cancer diagnoses and deaths occurring in patients aged 65 and older The aging of the Baby Boomer population along with an overall increase in life expectancy points to a doubling of the U S population over age 65 by the year 2030 This demographic shift combined with the known association of cancer and aging is expected to bring about a rapid growth in the older cancer patient population It is clear that geriatric principles must become part of oncology care The evaluation and development of treatment recommendations for an older adult with cancer can be challenging for many reasons Tumor biology and response to therapy are affected by age In addition age related factors may impact treatment patterns tolerance and efficacy These age related factors include functional status declines comorbid conditions changes in cognitive function weakening of organ function decreases in physiologic reserve and faltering social support
