The book proposed architecture and mathematical model of an artificial neural network for deep learning forecasting of short term electricity imbalances using hourly data. Using a model to aggregate data with an hourly resolution followed by forecasting to reduce forecast error, the quasi dynamic modeling method was used to analyze the impact of periodic generation on the network. The application of quasi dynamic modeling also allows taking into account the system load curve, generation profile, storage system as well as renewable energy sources RES operation in this area. The use of models makes it possible to achieve realistic estimates of generation for the required period. The book considers a local hybrid renewable energy system HRES based on different types of RES which is more efficient than a system with one type of source.
