Energy Research and Development Administration,1977 *Meshfree Methods for Partial Differential Equations II* Michael Griebel,Marc Alexander Schweitzer,2006-09-21 The numerical treatment of partial differential equations with particle methods and meshfree discretization techniques is a very active research field both in the mathematics and engineering community Due to their independence of a mesh particle schemes and meshfree methods can deal with large geometric changes of the domain more easily than classical discretization techniques Furthermore meshfree methods offer a promising approach for the coupling of particle models to continuous models This volume of LNCSE is a collection of the papers from the proceedings of the Second International Workshop on Meshfree Methods held in September 2003 in Bonn The articles address the different meshfree methods SPH PUM GFEM EFGM RKPM etc and their application in applied mathematics physics and engineering The volume is intended to foster this new and exciting area of interdisciplinary research and to present recent advances and results in this field *Optimal Sensor Networks Scheduling in Identification of Distributed Parameter Systems* Maciej Patan,2012-02-23 Sensor networks have recently come into prominence because they hold the potential to revolutionize a wide spectrum of both civilian and military applications An ingenious characteristic of sensor networks is the distributed nature of data acquisition Therefore they seem to be ideally prepared for the task of monitoring processes with spatio temporal dynamics which constitute one of most general and important classes of systems in modelling of the real world phenomena It is clear that careful deployment and activation of sensor nodes are critical for collecting the most valuable information from the observed environment Optimal Sensor Network Scheduling in Identification of Distributed Parameter Systems discusses the characteristic features of the sensor scheduling problem analyzes classical and recent approaches and proposes a wide range of original solutions especially dedicated for networks with mobile and scanning nodes Both researchers and practitioners will find the case studies the proposed algorithms and the numerical examples to be invaluable

*Control Systems with Saturating Inputs* Maria Letizia Corradini,Andrea Cristofaro,Fabio Giannoni,Giuseppe Orlando,2012-01-25 Saturation nonlinearities are ubiquitous in engineering systems every physical actuator or sensor is subject to saturation owing to its maximum and minimum limits Input saturation is an operating condition that is well known to the control community for its side effects which cause conventional controllers to lose their closed loop performance as well as control authority in stabilization Therefore the practical application of control theory cannot avoid taking into account saturation nonlinearities in actuators explicitly dealing with constraints in control design *Proceedings of the London*
