**MODEL BUILDING IN MATHEMATICAL PROGRAMMING**  
H.J. Williams, *Edinburgh University*

This book first discusses the general principles of model building in mathematical programming then presents 20 practical problems to which mathematical programming can be applied. These problems have been classified to avoid the tedious mechanical detail inherent in most text studies but the essence of the problems has been preserved and should be fully understood. Finally, suggested treatments and solutions to the problems are given in the last part of the book.

It emphasises the modelling as opposed to the algorithmic side of mathematical programming. The use of linear programming is covered and the transportation of the solution of a model (e.g. optimal costs, shadow prices, etc.) is given comprehensive treatment. Sensitivity analysis is discussed in detail.

**METHODS OF OPTIMIZATION**  
C.R. Woot, *University of York*

This book is concerned with the theory and practice of modern methods of minimizing or maximizing a function of many variables, with or without constraints. It shows how these methods have developed from classical calculus, on the one hand, and the most recent mathematical programming techniques, on the other. This is an introductory text on optimization with many exercises for the reader and is aimed at third-year university undergraduates and first-year postgraduate students.
