Nunez, 1999-10 Scope of Study This dissertation investigates the effect of cost and dose on the hemodialysis treatment modality This modality of dialysis is an alternative to renal transplantation for people diagnosed with end stage renal disease The mortality rate is used as a quality indicator of the hemodialysis treatment by assessing the quality of service in Colombia and comparing it with the quality of service in the United States Findings and Conclusions The hypothesis testing used in this research shows that there is a significant

difference between the delivered dose of hemodialysis in Colombia and the United States The mortality rate for patients in hemodialysis in Colombia for a comparable age group 45-64 is higher than that of the United States This is attributed in great part to the effect of the hemodialysis dose on the treatment A simple linear regression shows a strong negative relationship between mortality rate and dose Cost also has an impact on the quality of service of the hemodialysis therapy Nevertheless a direct relationship between cost and mortality rate could not be established Factors such as patient's vascular access and dialyzer flow rates are not evaluated in this investigation
