

Advances in serviceability and strength of normal- and high-strength concrete structures

Yew-Chayn Loo and Sanaul Huq Chowdhury
Griffith University, Australia

Summary

Serviceability and strength of concrete structures have been a topic of intense research for many years. Reported herein is the work conducted in this area, especially in the past decade, which ranges from the development of the layered finite element method and the associated theoretical studies to elaborate laboratory tests of high-strength concrete elements. In particular, serviceability studies reviewed include natural frequency, cracking and crack patterns, deflection and damping characteristics; strength investigations reviewed cover beams, slabs and walls, as well as the punching shear strength of

flat plates. A long-term on-site study of column shortening in an 80-storey residential building recently completed at Gold Coast in Southeast Queensland, Australia is also reported. In addition, a separate section discusses the serviceability studies specific for high-strength concrete structures. Summarized herein is the review of research findings published during the period spanning mainly from 1995 to 2005. Relevant formulas and analytical procedures which may assist practising engineers in the design of concrete structures are reported for completion.

Key words: axial shortening of columns; cracking and crack control; deflection; damping characteristics; punching shear strength of concrete flat plates; serviceability of high-strength concrete structures; ultimate loads of walls and slab panels

Introduction

For a concrete structure to be considered serviceable, cracking must be controlled and deflections must be within specified limits. Also, it must not vibrate excessively. Concrete strength characteristics play a major role in each of these three aspects of the service load behaviour. Serviceability, like the strength characteristics of concrete structures, is therefore of paramount importance, especially from a design perspective.

During the past decade, various researchers have conducted a considerable amount of research in the broad area of serviceability and strength characteristics of concrete structures. These covered both reinforced and prestressed concrete structures as well as different structural elements constructed of both normal- and high-strength concrete. This paper attempts to review and present a summary of the findings from these research efforts. A significant number of papers and reports in the subject area published by different researchers are discussed

herein. A brief description is given of each of these works which were published mainly between 1995 and 2005 with some earlier ones included for completeness.

The main purpose of this paper is to acquaint the reader with the considerable body of research work and relevant findings in the topical area. The publications reviewed herein are classified and described under the following headings:

- Cracking and crack control
- Deflection
- Damping characteristics
- Axial shortening of columns in tall buildings
- Punching shear strength of concrete flat plates
- Ultimate loads of walls and slab panels

High-strength concrete (HSC) being a relatively new material, the discussion on the serviceability studies of HSC structures has been presented in a separate section.

Long-term Serviceability of Concrete Structures, 1989 **Serviceability Limit State of Concrete Structures** FIB - International Federation for Structural Concrete, 2019-09-01 Serviceability limit states are essential for appropriate function and durability of concrete structures The attention is paid especially to the stress limitation crack width analysis and deflection analysis The document provides supplementary information to the fib Model Code 2010 MC2010 where a limited space did not allow for a detailed description of individual procedures The principles used in MC2010 in chapter 7 6 are explained in detail within this document The stress analysis is focused on stresses in concrete and steel including the stress redistribution due to the long term load and cracking of reinforced concrete and prestressed concrete elements Crack width analysis explains the mechanism of cracking under mechanical loading and due to deformation restraint Cracks in prestressed concrete elements are also discussed Deflection analyses with different levels of accuracy are described including the shear effects Examples illustrate the practical application of rules defined in the MC2010 of individual serviceability limit states Simplified and more general methods are used An important part of the bulletin shows the development and extension of the serviceability limit states after publishing of the MC2010 and alternative approaches Special attention is paid to deflections of prestressed concrete beams shear effects on deflection slenderness limits and influence of the concrete cover The final part deals with an application of numerical simulations **Long Term Durability of Structural Materials** P.J.M. Monteiro, K.P. Chong, J. Larsen-Basse, K. Komvopoulos, 2001-08-29 Long Term Durability of Structural Materials features proceedings of the workshop held at Berkeley CA in October 2000 It brought together engineers and scientists who have received grants from the initiative NSF 98 42 to share their results on the study of long term durability of materials and structures The major objective was to develop new methods for accelerated short term laboratory or in situ tests which allow accurate reliable predictions of the long term performance of materials machines and structures To achieve this goal it was important to understand the fundamental nature of the deterioration and damage processes in materials and to develop innovative ways to model the behavior of these processes as they affect the life and long term performance of components machines and structures The researchers discussed their approach to include size effects in scaling up from laboratory specimens to actual structures Accelerated testing and durability modeling techniques developed were validated by comparing their results with performance under actual operating conditions The main

mechanism of the deterioration discussed included environmental effects and or exposure to loads speeds and other operating conditions that are not fully anticipated in the original design A broad range of deterioration damage such as fatigue overload ultraviolet damage corrosion and wear was presented A broad range of materials of interest was also discussed including the full spectrum of construction materials metals ceramics polymers composites and coatings Emphasis was placed on scale dependence and history of fabrication on resulting mechanical behavior of materials **Short-Term and Long-Term Behaviour of Reinforced Self-Compacting Concrete Structures** Farhad Aslani, 2014-06-24 Volume is indexed by Thomson Reuters BCI WoS Self Compacting Concrete SCC refers to a highly flow able non segregating concrete that can be spread into place fill the formwork and encapsulate the reinforcement without the aid of any mechanical consolidation SCC is regarded as one of the most promising developments in concrete technology due to significant advantages over Conventional Concrete CC In this study cracking caused by external loads in reinforced SCC and FRSCC slabs is examined experimentally and analytically The mechanisms associated with the flexural cracking due to the combined effects of constant sustained service loads and shrinkage are observed One of the primary objectives of this study is to develop analytical models that accurately predict the hardened mechanical properties of SCC and FRSCC Subsequently these models have been successfully applied to simulate time dependent cracking of SCC and FRSCC one way slabs
