**Abstract** The purpose of this study was to determine the effect of a 12-week, supervised, resistance training program on the strength and endurance of the lower extremities in healthy young adults. The subjects were 15 male and 15 female college students, aged 18 to 25 years, who were randomly assigned to either the resistance training group or the control group. The resistance training group performed a 12-week, supervised, resistance training program consisting of three sessions per week. The control group performed no exercise. The subjects were tested at baseline and at 12 weeks for strength and endurance. The results showed that the resistance training group had significantly greater strength and endurance at 12 weeks compared to the control group. The results suggest that a 12-week, supervised, resistance training program can improve the strength and endurance of the lower extremities in healthy young adults.
