King, Robert S. Hahn, 2012-12-06 The latest information indicates that the United States now spends in excess of 150 billion annually to perform its metal removal tasks using conventional machining technology That estimate is increased from 115 billion 5 years ago It becomes clear that metal removal technology is a very important candidate for rigorous investigation looking toward improvement of productivity within the manufacturing system To aid in that endeavor an extensive program of research has developed within the industrial community with the express purpose of establishing a new scientific and applied base that will provide principles upon which new manufacturing decisions can be made One of the metal removal techniques that has the potential for great economic advantages is high rate metal removal with related

technologies This text is concerned with the field of grinding as a subset of the general field of high rate metal removal Related processes not covered in this text include such topics as turning drilling and milling In the final evaluation the correct decision in the determination of a grinding process must necessarily include an understanding of the other methods of metal removal The term grinding as used herein includes polishing buffing lapping and honing as well as conventional definition removing either metallic or other materials by the use of a solid grinding wheel American Machinist ,1917

Halevi,2013-04-17 Process planning determines how a product is to be manufactured and is therefore a key element in the manufacturing process It plays a major part in determining the cost of components and affects all factory activities company competitiveness production planning production efficiency and product quality It is a crucial link between design and manufacturing In spite of the importance of process planning in the manufacturing cycle there is no formal methodology which can be used or can help to train personnel for this job Process planning activities are predominantly labor intensive depending on the experience and the skill and intuition of the planner and therefore often precludes a thorough analysis and optimization of the process plan which nearly always results in higher than necessary production costs delays errors and non standardization of processes Process planning

is regarded as an art and not a science Research in the field of process planning has indicated that all experts have their own expertise and one expert's experience might be different from that of another It is rare therefore for two planners to produce the same process Each process will produce the part as specified although different processes will result in different processing times and costs The question is who is an expert By definition an expert is one having or manifesting the knowledge skill and experience needed for success in a particular field or endeavor or one who has acquired special skill in or knowledge and mastery of something
