Asaro, 2020-09-10 Once the stuff of science fiction, recent progress in artificial intelligence, robotics and machine learning means that these rapidly advancing technologies are finally coming into widespread use within everyday life. Such rapid development in these areas also brings with it a host of social, political and legal issues as well as a rise in public concern and academic interest in the ethical challenges these new technologies pose. This volume is a collection of scholarly work from leading figures in the development of both robot ethics and machine ethics; it includes essays of historical significance which have become foundational for research in these two new areas of study as well as important recent articles. The research articles selected focus on the control and governance of computational systems; the exploration of ethical and moral theories using software and robots as laboratories or simulations; inquiry into the necessary requirements for moral agency and the basis and boundaries of rights and questions of how best to design systems that are both useful and morally sound. Collectively, the articles ask what the practical ethical and legal issues arising from the development of robots will be over the next twenty years and how best to address these future considerations. **Oversight Hearings** Fusion Advisory Panel

Clothes in Late-Victorian England Clare Rose, 2010 Drawing upon a remarkable variety of documentary evidence, this study argues that much of Britain's consumer culture and modern business practices were influenced by the ready-to-wear market in boys' clothes. Through a detailed visual and statistical analysis of these sources, linking the design and retailing of boys' clothing with social, cultural and economic issues, it shows that an understanding of the production and consumption of the boys' clothing is central to debates on the growth of the consumer society, the development of mass market fashion and concepts of childhood and masculinity. **Industrial Innovation in China** Zhenyu Fu, 2021-09-30 This book, based on

extensive original research, examines the factors which lead to successful innovation in Chinese industry. Considering the large and important Chinese mining industry in detail, it argues that innovation is key for success in all industries, not just new tech industries. It reveals how the interaction of universities, governments and industries is highly significant, considers how some parts of the industry such as the mining and mineral processing stages are more innovative than other stages such

as prospecting and mining equipment manufacturing and suggests that this is explained both by the distance between final products and the market and commercialisation and by the intensity of the interaction between the industrial company and the university or research institute Throughout the book includes examples and case studies to highlight the points made

Virtual Machines Iain D. Craig, 2010-05-17 I love virtual machines VMs and I have done for a long time If that makes me sad or an anorak so be it I love them because they are so much fun as well as being so useful They have an element of original sin writing assembly programs and being in control of an entire machine while still being able to claim that one is being a respectable member of the community being structured modular high level object oriented and so on They also allow one to design machines of one's own unencumbered by the restrictions of a starts optimising it for some physical particular processor at least until one processor or other I have been building virtual machines on and off since 1980 or thereabouts It has always been something of a hobby for me it has also turned out to be a technique of great power and applicability I hope to continue working on them perhaps on some of the ideas outlined in the last chapter I certainly want to do some more work with register based VMs and concurrency I originally wanted to write the book from a purely semantic viewpoint
