Hockenbery,2016-04-29 This volume examines the role of mitochondria in different types of cell death including apoptotic and necrotic cell deaths Topics discussed include mitochondrial outer membrane permeabilization MOMP and the permeability transition pore core processes such as calcium handling fission and fusion reactive oxygen species generation and maintenance of mitochondrial DNA fidelity and protein folding homeostasis and retrograde signaling between mitochondria and other cellular components including the important role of mitochondria in antiviral immunity The expertly authored chapters are drawn from multidisciplinary international perspectives lending a nuanced and comprehensive approach to the material Mitochondria and Cell Death part of the Cell Death in Biology and Diseases series is invaluable reading for graduate students researchers and clinicians in the fields of neuroscience oncology gastroenterology and hepatology as well as those interested in the study of mitochondria and cell biology **Mitochondria: the cell powerhouse and nexus of stress** Sabzali Javadov,Andrey V. Kuznetsov,2014-09-23 Mitochondrion a sub cellular organelle originated from primary endosymbiosis plays a vital role in energy metabolism of eukaryotic cells The transfer of electrons through the electron transport chain ETC to molecular oxygen accompanied by the extrusion of protons from the matrix generate an electrochemical gradient across the inner mitochondrial membrane IMM that is used for ATP synthesis by oxidative phosphorylation Despite many aspects of ATP synthesis have been delineated regulatory mechanisms responsible for energy synthesis and transfer still remain to be uncovered In addition to energy function mitochondria play a crucial role in cell metabolism under both physiological and pathological conditions through their participation in many intracellular signaling pathways Studies over the last 30 years provide strong evidence that mitochondria are the nexus of various stresses which initiate cell death through apoptosis oncosis necrosis and autophagy depending on the severity of the stress and cellular energy status The release of several pro apoptotic proteins such as cytochrome c Smac DIABLO AIF endonuclease G from intermembrane space initiates both caspase dependent and caspase independent apoptosis The formation of the mitochondrial permeability transition pore in the IMM promotes cell death mostly through necrosis whereas a mild stress activates autophagy Due to their critical roles in both cell death and survival mitochondria have been widely considered as an important target for various pharmacological and conditional therapeutic approaches Currently a large number of mitochondria targeted agents are suggested to prevent in ischemia reperfusion injury cardiovascular neurodegenerative and other diseases or stimulate in various cancers cell death This Research Topic focuses on the role of mitochondria in the regulation of cell metabolism and signaling under physiological and pathological conditions Studies performed on cultured cells and isolated organs tissues using different animal and cellular models of various diseases are also included and discussed **Mitochondria** Stephen W. Schaffer,M. Saadeh Suleiman,2010-02-24 The term

mitochondrion is derived from Latin with *mitos* meaning thread and *chondrion* meaning granules. Indeed under the light microscope mitochondria often appear as rods or granules within the cytoplasm. For decades after initial visualization of mitochondria by light microscopy mitochondrial function remained clouded. However with the development of differential centrifugation and electron microscopy it was discovered that a chief function of the mitochondria was the generation of ATP for the remainder of the cell. For many years the energy generating function of the mitochondria was considered the primary if not the sole function of the mitochondria. During that period investigators attempted to obtain information on the mechanism of ATP synthesis and the regulation of electron transport. In the first chapter of the book Dr Hassinen summarizes those studies providing clear pictures on the transformation of reducing equivalents into a proton gradient and the mechanism by which the F₁F₀ ATPase utilizes the proton gradient to generate ATP. He also summarizes the key regulatory steps of the citric acid cycle which is the major source of reducing equivalents for the electron transport chain. In the heart most of the carbon that feeds into the citric acid cycle is derived from fatty acid metabolism. Although fatty acid utilization provides most of the ATP for contraction a proper balance must be maintained between the utilization of fatty acids and that of glucose. In the second chapter Drs

SENSORY HAIR CELL DEATH AND REGENERATION, 2nd Edition Michael E.

Smith,Andrew K. Groves,Allison B. Coffin,2025-01-23 Sensory hair cells are the mechanosensory receptors of the auditory and vestibular systems in all vertebrates and of the lateral line system of some aquatic vertebrates. Hair cells can be damaged and lost due to such factors as aging ototoxic chemicals acoustic trauma infection or genetic factors. Loss of these hair cells lead to deficits in hearing and balance and in mammals such deficits are permanent. In contrast non mammalian vertebrates exhibit the capability to regenerate missing hair cells. Researchers have been examining the process of hair cell death and regeneration in animal models in an attempt to find ways of either preventing hair cell loss or stimulating the production of

new hair cells in mammals with the ultimate goal of finding new therapeutics for human sensorineural hearing and balance deficits This has led to a wide array of research on hair cells such as understanding the factors that cause hair cell loss and finding agents that protect them from damage elucidating the apoptotic pathways activated during hair cell death examining the genes and cellular pathways that are regulated during the process of hair cell death and regeneration and characterizing the functional sensory loss and recovery following hair cell death and regeneration This research has involved cell and developmental biologists physiologists geneticists bioinformaticians and otolaryngologists In this Research Topic we wish to summarize and review recent progress of hair cell regeneration research and collate original articles advancing sensory hair cell death and regeneration research into the future Plant Programmed Cell Death Arunika N. Gunawardena,Paul F.

McCabe,2015-10-08 Programmed cell death PCD is a genetically encoded active process which results in the death of individual cells tissues or whole organs PCD plays an essential role in plant development and defense and occurs throughout a plant s lifecycle from the death of the embryonic suspensor to leaf and floral organ senescence In plant biology PCD is a relatively new research area however as its fundamental importance is further recognized publications in the area are beginning to increase significantly The field currently has few foundational reference books and there is a critical need for books that summarizes recent findings in this important area This book contains chapters written by several of the world s leading researchers in PCD This book will be invaluable for PhD or graduate students or for scientists and researchers entering the field Established researchers will also find this timely work useful as an up to date overview of this fascinating research area *Mitochondria: The Anti- cancer Target for the Third Millennium* Jiri Neuzil,Shazib Pervaiz,Simone

Species in Cancer Treatment Neeraj Mishra,Ravinder Kumar Kaundal,2024-09-01 Autophagy is a catabolic process that eliminates damaged and faulty cellular components via lysosomes It responds to adverse circumstances like nutritional deficiency hypoxia and oxidative damage Reactive oxygen species ROS cause oxidative stress which is a multidimensional chemical that drives various pathophysiological diseases including cancer In addition the autophagy process has a double role first preventing tumour formation but later fostering tumour progression A growing body of research suggests that autophagy and ROS have a complex interplay in which they can either prevent cancer growth or enhance disease genesis While a combination of autophagy inhibitor and cytotoxic medicines is now being used in cancer treatment investigating the potential of autophagy inhibitors for overcoming resistance to different anticancer medications and how this relates to the control of cancer micro environmental stressors raises several questions Autophagy s dual functions as a safeguarding and

cytotoxic process have drawn attention to its significance in the development of cancer

Cell Death Hao Wu, 2013-11-19. Beginning from centuries of anecdotal descriptions of cell death such as those on the development of the midwife toad in 1842 by Carl Vogt to modern-day investigations of cell death as a biological discipline, it has become accepted that cell death in multicellular organisms is a normal part of life. This book provides a comprehensive view of cell death from its mechanisms of initiation and execution to its implication in human disease and therapy. Physiological cell death plays critical roles in almost all aspects of biology, and the book details its roles in lymphocyte homeostasis, neuronal function, metabolism, and the DNA damage response. When physiological cell death goes awry, diseases can arise, and cancer is presented as a central paradigm for the consequences of derangements in the interplay between cell survival and cell death. At the same time, the potential promise of targeted therapies aimed at interdicting cell death machineries are also discussed extensively. The molecular mechanisms that underlie apoptotic cell death are illustrated from the perspectives of both the intrinsic mitochondrial apoptotic pathway and the extrinsic death receptor pathway. Key players in these pathways such as the Bcl2 family proteins, cytochrome c, Apaf-1, caspases, death receptor adapter proteins, and inhibitor of apoptosis proteins are presented from both functional and structural angles. Until only a few years ago, programmed cell death has been considered essentially synonymous with apoptosis. However, we now know that programmed cell death can also take other forms such as necrosis or necroptosis, and

to this end the mechanisms that underlie programmed necrosis in development and host defense are illustrated The past twenty plus years have seen an incredible growth of research in cell death with one breakthrough after another and the legacy still goes on with constant new surprises and findings Long live cell death
