The Mechanism in Gut Microbiota of Diabetes and Endocrine Complications: Preventive and Therapeutic Target 12k Guojun Wu,Huijuan Yuan, Li Yan,2025-08-20

In recent years growing attention has been allocated to the relationship between the gut microbiome and disease especially the complex relationship between diabetes and endocrine complications The gut microbiota is one of the most complex microbial communities and has formed a close symbiotic relationship with its host in a long period of co evolution Beneficial bacteria can produce a variety of bioactive substances and participate in host nutrition metabolism immunity and behavioral regulation by regulating host gene expression Hence the role of gut microbiota which is ecologically dominated by beneficial bacteria as a second genome in maintaining human homeostasis has attracted more and more attention in recent years On the other hand many opportunistic pathogens and miscellaneous bacteria can produce toxic metabolites lurking in the gut and the dysbacteria can lead to insulin resistance and inflammation which may disrupt the metabolic balance of the host Changing the microbiome structure through lifestyle interventions medications and fecal microbiota transplantation can be beneficial for disease related phenotypes Therefore understanding the subtle interactions within the microbiome is crucial for deciphering the complex pathogenesis of diabetes and endocrine complications

Interphase Between Aging and Neurodegenerative Diseases Walter E. Müller, Anne Eckert, P. Hemachandra Reddy, 2020-01-21 The purpose of this Research Topic is to discuss the latest developments in aging and neurodegenerative diseases Aging represents the major risk factor of the two most relevant neurodegenerative diseases Parkinson's disease PD and Alzheimer's disease AD It is generally accepted that symptoms of PD correlate with the severity of degeneration of dopaminergic substantia nigra neurons In most cases neuronal loss during aging is not sufficient to cause clinical symptoms but only leads to a preclinical state of PD However in a small number of our population neurodegeneration by aging gets accelerated by individual e.g. brain injuries environmental e.g. toxins and genetic e.g. mutations of the alpha synuclein gene factors to reach the critical threshold for clinical symptoms during lifetime Thus neurodegeneration in PD appears to represent the common final pathway of normal brain aging and all other risk factors including genetics and the accumulation of the neurotoxic alpha synuclein protein While aging alone is generally agreed to be sufficient for at least the preclinical state of PD the situation in AD seems to be different Aging as the major and well documented risk factor of AD has been neglected for decades Biochemical mechanisms of brain aging and the cognitive deficits of normal brain aging were seen as two not related and independent processes not related to AD AD has always been characterized for decades by the presence of histopathological alterations extracellular amyloid containing plaques and intracellular tangles of hyperphosphorylated tau protein by neurodegeneration synaptic deficits and finally neuronal loss as well as by severe cognitive deficits clinically often accompanied by neuropsychiatric symptoms like delusions as already described in the first famous patient Auguste D at the Psychiatric Hospital of Frankfurt If or if not one or both of the two histopathological hallmarks play a causative role remains unclear until now The discovery of homozygotic risk genes in most of the very rare probably less than 1% cases of early onset AD which share increased production of amyloid A as one but probably not the only one common property led to the hypothesis of A as the major causative factor for the development of AD It was neglected that plaques density in the brain of AD patients did not correlate with presence and severity of clinical symptoms while synaptic deficits did so even in first observations already published many years ago Based on the Amyloid hypothesis many drug treatments to remove A plaques were developed Even if all seemed to remove A to some extent all strategies failed to improve the symptoms of dementia Thus other concepts to explain the development of clinical symptoms of AD over time are needed These should include the brain aging process not only as a statistical but also as a causative contributing factor These concepts should not only rely on cell or animal models but should much more take into account the disease and the patients A closer look at the situation in PD will certainly be helpful

Molecular Mechanisms and Physiological Significance of Organelle Interactions and Cooperation Michael Schrader, Markus Islinger, 2017-02-28 Eukaryotic cells contain distinct membrane bound organelles which compartmentalise cellular proteins to fulfil a variety of vital functions Many organelles have long been regarded as isolated and static entities e.g. peroxisomes mitochondria lipid droplets but it is

now evident that they display dynamic changes interact with each other share certain proteins and show metabolic cooperation and cross talk Despite great advances in the identification and characterisation of essential components and molecular mechanisms associated with the biogenesis and function of organelles information on how organelles interact and are incorporated into metabolic pathways and signaling networks is just beginning to emerge Organelle cooperation requires sophisticated targeting systems which regulate the proper distribution of shared proteins to more than one organelle Organelle motility and membrane remodeling support organelle interaction and contact This contact can be mediated by membrane proteins residing on different organelles which can serve as molecular tethers to physically link different organelles together They can also contribute to the exchange of metabolites and ions or act in the assembly of signaling platforms In this regard organelle communication events have been associated with important cellular functions such as apoptosis antiviral defense organelle division biogenesis ROS metabolism and signaling and various metabolic pathways such as breakdown of fatty acids or cholesterol biosynthesis In this research topic we will focus on recent novel findings on the underlying molecular mechanisms and physiological significance of organelle interaction and cooperation with a particular focus on mitochondria peroxisomes endoplasmic reticulum lysosomes and lipid droplets and their impact on the regulation of cellular homeostasis Our understanding of how organelles physically interact and use cellular signaling systems to coordinate functional networks between each other is still in its infancy Nevertheless recent discoveries of defined membrane structures such as the mitochondria ER associated membranes MAM are revealing how membrane domains enriched in specific proteins transmit signals across organelle boundaries allowing one organelle to influence the function of another In addition to its role as a mediator between mitochondria and the ER contacts between the MAM and peroxisomes contribute to antiviral signaling and specialised regions of the ER are supposed to initiate peroxisome biogenesis whereas intimate contacts between peroxisomes lipid droplets and the ER mediate lipid metabolism In line with these observations it is tempting to speculate that further physical contact sites between other organelles exist Alternatively novel regulated vesicle trafficking pathways between organelles e g mitochondria to peroxisomes or lysosomes have been discovered implying another mode of organelle communication Identifying the key molecular players of such specialised membrane structures will be a prerequisite to understand how organelle communication is physically accomplished and will lead to the identification of new regulatory networks In addition to the direct transmission of interorganellar information cytosolic messenger systems e g kinase phosphatase systems or redox signaling may contribute to the coordination of organelle functions This research topic will integrate new findings from both modes of communication and will provide new perspectives for the functional significance of cross talk among organelles We would like to thank all the researchers who contributed their valuable work to this research topic Furthermore we are grateful to the reviewers and Associate Editors who contributed valuable comments and positive criticism to improve the contributions

The Skeletal Muscle: Plasticity, Degeneration and Epigenetics Li Li Ji, 2025-09-30 Skeletal muscle is not an organ merely for locomotion with simple anatomical and metabolic features as has been viewed for a long time The understanding that physical activity plays a vital role in health promotion and disease prevention under the slogan of exercise is medicine has dramatically increased the enthusiasm and demand for knowledge about the skeletal muscle This book *The Skeletal Muscle Plasticity Degeneration and Epigenetics* is a follow up of another book authored by the Editor which provides the morphological physiological biochemical and molecular biological foundations for organ s response and adaptation to functional demand and for the mechanisms and prevention for the organ s pathogenesis and degeneration Research in the past several decades has demonstrated that skeletal muscle has a tremendous ability to undergo internal changes in response to functional environmental nutritional and genetic challenges through various neural endocrine and autocrine pathways for signal transduction Although the contractile proteins show a relatively slow turnover many organelles and constituents in the myocyte exhibit considerable remodeling throughout the muscle s life cycle In this regard mitochondrion plays a central role in the crosstalk of signaling not only in its own turnover and quality control but also in exerting important influences on other vital cellular functions On the opposite side skeletal muscle is highly vulnerable to disuse and misuse that can cause injury inflammation degeneration and atrophy The various chapters in this book contributed by the experts in the field will introduce and review the most concurrent knowledge to address important issues related to muscle plasticity pathogenesis disease and aging Potential strategies to prevent and ameliorate the above problems in a whole body perspective will be highlighted to provide the readers with the inspiration to learn and work with this important and intriguing organ
