Abstract

Language Model Programs, i.e. sophisticated pipelines of modular language model (LM) calls, are increasingly advancing NLP tasks. However, building these pipelines requires crafting prompts that are jointly effective for all modules. We study prompt optimization for LM programs, i.e. how to update these prompts to maximize a downstream metric without access to module-level labels or gradients. To make this tractable, we factorize our problem into optimizing the two form in

Artificial Life Models in Software Andrew Adamatzky, Maciej Komosinski, 2006-01-20 Artificial life is an interdisciplinary field of science hosting experts from computer science biology physics chemistry and mathematics as well as philosophers and artists It focuses on studying the phenomena of life on all levels of complexity and organization molecular cellular organismic and population These studies not only employ conventional computers using both software and hardware but also take place in wetware using techniques of biochemical laboratory Artificial life research is not limited to life forms existing on the Earth It rather attempts to study the general principles of life which are common to all instances of life both already recognized and yet unknown This book is dedicated to the software medium the most popular and widely employed in the artificial life research The software medium offers almost unlimited abilities for experiments which are cheap easily arranged and modified Additionally such experiments can be repeated under the same conditions and large amounts of data unavailable in biological studies can be collected for analysis To begin experimentation a model of life is required Such models are built in software for all organizational levels of life Most of the models described in this book are very general and therefore allow for a wide range of experiments **Catalog of Copyright Entries. Concepts, Models, Complex Systems Architectures Vyacheslav Kharchenko, Yuriy Kondratenko, Janusz Kacprzyk, 2016-09-21 This volume provides a comprehensive state of the art overview of a series of advanced trends and concepts that have recently been proposed in the area of green information technologies engineering as well as of design and development methodologies for models and complex systems architectures and their intelligent components The contributions included in the volume have their roots in the authors presentations and vivid discussions that have followed the presentations at a series of workshop and seminars held within the international TEMPUS project GreenCo project in

United Kingdom Italy Portugal Sweden and the Ukraine during 2013 2015 and at the 1st 5th Workshops on Green and Safe Computing GreenSCom held in Russia Slovakia and the Ukraine The book presents a systematic exposition of research on principles models components and complex systems and a description of industry and society oriented aspects of the green IT engineering A chapter oriented structure has been adopted for this book following a vertical view of the green IT from hardware CPU and FPGA and software components to complex industrial systems The 15 chapters of the book are grouped into five sections 1 Methodology and Principles of Green IT Engineering for Complex Systems 2 Green Components and Programmable Systems 3 Green Internet Computing Cloud and Communication Systems 4 Modeling and Assessment of Green Computer Systems and Infrastructures and 5 Green PLC Based Systems for Industry Applications The chapters provide an easy to follow comprehensive introduction to the topics that are addressed including the most relevant references so that anyone interested in them can start the study by being able to easily find an introduction to the topic through these references At the same time all of them correspond to different aspects of the work in progress being carried out by various research groups throughout the world and therefore provide information on the state of the art of some of these topics challenges and perspectives

Performance Modeling for Computer Architects C. M. Krishna, 1995-10-14 As computers become more complex the number and complexity of the tasks facing the computer architect have increased Computer performance often depends in complex way on the design parameters and intuition that must be supplemented by performance studies to enhance design productivity This book introduces computer architects to computer system performance models and shows how they are relatively simple inexpensive to implement and sufficiently accurate for most purposes It discusses the development of performance models based on queuing theory and probability The text also shows how they are used to provide quick approximate calculations to indicate basic performance tradeoffs and narrow the range of parameters to consider when determining system configurations It illustrates how performance models can demonstrate how a memory system is to be configured what the cache structure should be and what incremental changes in cache size can have on the miss rate A particularly deep knowledge of probability theory or any other mathematical field to understand the papers in this volume is not required
