Macclade 4 Analysis Of Phylogeny And Character Evolution:

MacClade Wayne P. Maddison, David R. Maddison, 1992 MacClade is a computer program for graphic and interactive analysis of phylogeny and character evolution for Apple Macintosh computers. It displays a cladogram and paints the branches to indicate reconstructed character evolution. The user can manipulate cladograms on screen as MacClade gives diagnostic feedback. Systematics and other evolutionary biologists can use its flexible and analytical tools to examine phylogenies or interpret character evolution in a phylogenetic context; yet its ease of use should allow students to grasp phylogenetic principles in an interactive environment. This is the user's manual. *Plant Systematics* Michael G. Simpson, 2011-08-09 *Plant Systematics* is a comprehensive and beautifully illustrated text covering the most up to date and essential paradigms, concepts, and terms required for a basic understanding of plant systematics. This book contains numerous cladograms that illustrate the evolutionary relationships of major plant groups with an emphasis on the adaptive significance of major evolutionary novelties. It provides descriptions and classifications of major groups of angiosperms including over 90 flowering plant families, a comprehensive glossary of plant morphological terms, as well as appendices on botanical illustration and plant descriptions. Pedagogy includes review questions, exercises, and references that complement each chapter. This text is ideal for graduate and undergraduate students in botany, plant taxonomy, plant systematics, plant pathology, ecology, as well as faculty and researchers in any of the plant sciences. The Henry Allan Gleason Award of The New York Botanical Garden awarded for Outstanding recent publication in the field of plant taxonomy, plant ecology, or plant geography. 2006. Contains numerous cladograms that illustrate the evolutionary relationships of major plant groups with an emphasis on the adaptive significance of major evolutionary novelties. Provides descriptions and classifications of major groups of angiosperms including over 90 flowering plant families. Includes a comprehensive glossary of plant morphological terms, as well as appendices on botanical illustration and plant description. *Excerpts from MacClade* Sinauer Associates, Incorporated, Wayne P. Maddison, David R. Maddison, 1999. Parsimony, Phylogeny, and Genomics Victor A. Albert, 2005-03-24 Parsimony analysis cladistics has long been one of the most widely used methods of phylogenetic inference in the fields of systematic and evolutionary biology. Moreover, it has mathematical attributes that lend itself for use with complex genomic scale data sets. This book demonstrates the potential that this powerful hierarchical data summarization method also has for both structural and functional comparative genomic research. *Molecular Evolution* Ziheng Yang, 2014-05-16 Studies of evolution at the molecular level have experienced phenomenal growth in the last few decades due to rapid accumulation of genetic sequence data, improved computer hardware and software, and the development of sophisticated analytical methods. The flood of genomic data has generated an acute need for powerful statistical methods and efficient computational algorithms to enable their effective analysis and interpretation. *Molecular Evolution* a statistical approach presents and explains modern statistical methods and computational algorithms for the comparative analysis of

genetic sequence data in the fields of molecular evolution molecular phylogenetics statistical phylogeography and comparative genomics Written by an expert in the field the book emphasizes conceptual understanding rather than mathematical proofs The text is enlivened with numerous examples of real data analysis and numerical calculations to illustrate the theory in addition to the working problems at the end of each chapter The coverage of maximum likelihood and Bayesian methods are in particular up to date comprehensive and authoritative This advanced textbook is aimed at graduate level students and professional researchers both empiricists and theoreticians in the fields of bioinformatics and computational biology statistical genomics evolutionary biology molecular systematics and population genetics It will also be of relevance and use to a wider audience of applied statisticians mathematicians and computer scientists working in computational biology

Phylogeny and Conservation Andy Purvis, John L. Gittleman, Thomas M. Brooks, 2005-09-22
Phylogeny is a potentially powerful tool for conserving biodiversity This book explores how it can be used to tackle questions of great practical importance and urgency for conservation Using case studies from many different taxa and regions of the world the volume evaluates how useful phylogeny is in understanding the processes that have generated today's diversity and the processes that now threaten it The urgency with which conservation decisions have to be made as well as the need for the best possible decisions make this volume of great value to researchers practitioners and policy makers

the dissemination of scientific knowledge about species by taking full advantage of electronic data and bioinformatics tools. The first part focuses on the development of an electronic monograph of the papaya family Caricaceae using existing infrastructures of Information Technology IT and bioinformatic tools that together set the stage for a new era of systematics. Based on the plastid and nuclear DNA data the author inferred historical processes in the second part that may have shaped the evolution of the Caricaceae and explain their current geographic distribution. The last part is dedicated to the evolution of chromosome numbers in the Caricaceae and includes counts for species from three genera *Cylicomorpha*, *Horovitzia*, *Jarilla* that have never been investigated before.

Microbial Nitrogen Cycling Dynamics in Coastal Systems Annika Carlene Mosier, 2011

Human influence on the global nitrogen cycle e.g. through fertilizer and wastewater runoff has caused a suite of environmental problems including acidification, loss of biodiversity, increased concentrations of greenhouse gases and eutrophication. These environmental risks can be lessened by microbial transformations of nitrogen: nitrification converts ammonia to nitrite and nitrate which can then be lost to the atmosphere as N_2 gas via denitrification or anammox. Microbial processes thus determine the fate of excess nitrogen and yet recent discoveries suggest that our understanding of these organisms is deficient. This dissertation focuses on microbial transformations of nitrogen in marine and estuarine systems through laboratory and field studies using techniques from genomics, microbial ecology and microbiology. Recent studies revealed that many archaea can oxidize ammonia (AOA), ammonia oxidizing archaea, in addition to the well described ammonia oxidizing bacteria (AOB). Considering that these archaea are among the most abundant organisms on Earth, these findings have necessitated a reevaluation of nitrification to determine the relative contribution of AOA and AOB to overall rates and to determine if previous models of global nitrogen cycling require adjustment to include the AOA. I examined the distribution, diversity and abundance of AOA and AOB in the San Francisco Bay estuary and found that the region of the estuary with low salinity and high C:N ratios contained a group of AOA that were both abundant and phylogenetically distinct. In most of the estuary where salinity was high and C:N ratios were low, AOB were more abundant than AOA despite the fact that AOA outnumber AOB in soils and the ocean, the two end members of an estuary. This study suggested that a combination of environmental factors including carbon, nitrogen and salinity determine the niche distribution of the two groups of ammonia oxidizers. In order to gain insight into the genetic basis for ammonia oxidation by estuarine AOA, we sequenced the genome of a new genus of AOA from San Francisco Bay using single cell genomics. The genome data revealed that the AOA have genes for both autotrophic and heterotrophic carbon metabolism, unlike the autotrophic AOB. These AOA may be chemotactic and motile based on numerous chemotaxis and motility associated genes in the genome and electron microscopy evidence of flagella. Physiological studies showed that the AOA grow aerobically but they also oxidize ammonia at low oxygen concentrations and may produce the potent greenhouse gas N_2O . Continued cultivation and genomic sequencing of AOA will allow for in depth studies on the physiological and metabolic potential of this novel group of organisms that will ultimately

advance our understanding of the global carbon and nitrogen cycles Denitrifying bacteria are widespread in coastal and estuarine environments and account for a significant reduction of external nitrogen inputs thereby diminishing the amount of bioavailable nitrogen and curtailing the harmful effects of nitrogen pollution I determined the abundance community structure biogeochemical activity and ecology of denitrifiers over space and time in the San Francisco Bay estuary Salinity carbon nitrogen and some metals were important factors for denitrification rates abundance and community structure Overall this study provided valuable new insights into the microbial ecology of estuarine denitrifying communities and suggested that denitrifiers likely play an important role in nitrogen removal in San Francisco Bay particularly at high salinity sites
