Patternmaking for a Perfect Fit Steffani

Lincecum, 2010-10-19 What's the Secret to Sewing Great Fitting Garments? The Rub off the Insider's Technique for Creating a Great Fitting Pattern. Do you love to sew your own clothes but find it difficult to make commercial patterns fit? Has your favorite blouse seen better days but is no longer available in stores? Have you gained or lost weight so that your most flattering skirt doesn't fit quite right or would you like to update it by remaking it in a new fabric or adding new details? If you answered yes to any of these questions, you'll find the solution right in your own closet by creating customized sewing patterns using garments you already own and love to wear. In *Patternmaking for a Perfect Fit*, Hollywood and theater costume designer Steffani Lincecum demonstrates the rub off, a method of pattern drafting used by fashion and costume industry professionals that traces an existing garment or accessory without deconstructing or damaging it. Steffani starts with the basics, outlining two rub off methods: tracing onto paper or draping with fabric, and explaining essential tools, materials, and sewing techniques. She then shows how to duplicate a skirt, a dress, a blouse, and a handbag from rubbing off the original to creating the pattern to cutting and sewing the new version to making adjustments and incorporating a variety of other elements and details, not only refreshing your favorite fashions but replenishing your whole wardrobe with brand new looks.

Protein Function Prediction for Omics Era

Daisuke Kihara, 2011-04-19 Gene function annotation has been a central question in molecular biology. The importance of computational function prediction is increasing because more and more large scale biological data, including genome sequences, protein structures, protein-protein interaction data, microarray expression data, and mass spectrometry data, are awaiting biological interpretation. Traditionally, when a genome is sequenced, function annotation of genes is done by homology search methods such as BLAST or FASTA. However, since these methods are developed before the genomics era, conventional use of them is not necessarily most suitable for analyzing a large scale data. Therefore, we observe emerging development of computational gene function prediction methods which are targeted to analyze large scale data and also those which use such omics data as an additional source of function prediction. In this book, we overview this emerging exciting field. The authors have been selected from: 1) those who develop novel purely computational methods; 2) those who develop function prediction methods which use omics data; 3) those who maintain and update data base of function annotation of particular model organisms, *E. coli*, which are frequently referred.

Virtual Drug Design Daniela Schuster, Honglin Li, 2020-01-13

In the current drug research environment, in academia and industry, cheminformatics and virtual screening methods are well established and integrated tools. Computational tools are used to predict a compound's 3D structure, the 3D structure and function of a pharmacological target, ligand-target interactions, binding energies, and other factors essential for a successful drug. This includes molecular properties such as solubility, logP value, susceptibility to metabolism, cell permeation, blood-brain barrier permeation, interaction with drug transporters, and potential off-target effects. Given that approximately 40 million

unique compounds are readily available for purchase such computational modeling and filtering tools are essential to support the drug discovery and development process The aim of all these calculations is to focus experimental efforts on the most promising candidates and exclude problematic compounds early in the project In this Research Topic on virtual activity predictions we cover several aspects of this research area such as historical perspectives data sources ligand treatment virtual screening methods hit list handling and filtering
