Abstract This study proposes a modeling methodology for the description of tribo-dynamic behavior of generic point contacts, considering surface defect/failure type of excitation. A twin-disk contact set-up is developed to experimentally determine the acceleration induced by lab-controlled groove surface feature present on one of the mating surfaces. The periodic passage of this artificial surface defect through lubricated contact zone leads to contact force fluctuation, and consequently normal direction dynamic relative displacement and relative velocity of the contact bodies. These dynamic responses impact the lubrication film thickness and flow, altering the tribological performance that governs the contact force. Implementing this interaction loop between dynamics and tribology, the computational simulations are shown to be able to yield fairly accurate predictions in comparison to the measured acceleration signals.

1 Introduction

Dynamic responses, such as noise and vibration, are common in applications of high-speed rolling mechanical elements (gears and bearings for instance), whose cyclic contact actions are deemed to be the main sources of excitations [1–7]. From an interdisciplinary point of view, dynamic vibration has been shown to have large influence on tribological performance occurring at the interface of contacting components, including fluctuating normal force and lubricant viscosity [8, 9]. Although the physical interactions between tribology and dynamics are evident and substantial [9], a majority of works in the literature focused on only one way of impact. In the early 80s of last century, Wang and Cheng [10] numerically evaluated the thermal elastohydrodynamic lubrication (EHL) solutions of spur gear contacts subject to dynamic tooth force. Considering both normal and tangential vibrations, Yang et al. [11] investigated the responses in terms of lubrication film thickness, pressure, and temperature of a line contact. Both studies assumed perfectly smooth surfaces. Including surface roughness effects, Mohammadpour et al. [12] examined friction and efficiency of planetary gear systems through mixed thermal EHL analyses under dynamic condition. Joining a lumped parameter vibratory model to EHL governing equations, Li and Kahraman [8] demonstrated the unique transient gear EHL behavior under nonlinear dynamic

Point Of Contacts:

RAMSETE Salvatore Nicosia, Bruno Siciliano, Antonio Bicchi, Paolo Valigi, 2003-07-01 Robotics applications initially developed for industrial and manufacturing contexts are now strongly present in several fields. Besides well known space and high technology applications, robotics for every day life and medical services is becoming more and more popular. As an example, robotic manipulators are particularly useful in surgery and radiation treatments; they could be employed for civil demining for helping disabled people and ultimately for domestic tasks, entertainment and education. Such a kind of robotic applications require the integration of many different skills. Autonomous vehicles and mobile robots in general must be integrated with articulated manipulators. Many robotic technologies, sensors, actuators and computing systems must be properly used with specific technologies: localisation, planning and control technologies. The task of designing robots for these applications is a hard challenge: a specific competence in each area is demanded in the effort of a truly integrated multidisciplinary design.

Elastohydrodynamic Lubrication for Line and Point Contacts Ilya I. Kudish, 2013-06-17

Elastohydrodynamic Lubrication for Line and Point Contacts: Asymptotic and Numerical Approaches describes a coherent asymptotic approach to the analysis of lubrication problems for heavily loaded line and point contacts. This approach leads to unified asymptotic equations for line and point contacts as well as stable numerical algorithms for the solution of these elastohydrodynamic lubrication (EHL) problems. A Unique Approach to Analyzing Lubrication Problems for Heavily Loaded Line and Point Contacts. The book presents a robust combination of asymptotic and numerical techniques to solve EHL problems for lightly and heavily loaded line and point contacts. It also proposes a reasonably simple and naturally based regularization approach that produces stable solutions in heavily loaded EHL contacts. The book offers a clear understanding of the processes taking place in heavily loaded line and point EHL contacts as well as of the proper solution structure for EHL problems. It outlines concrete ways to determine important design parameters such as lubrication film thickness and frictional stresses and forces. The book establishes a close link between EHL problems for heavily loaded point and line contacts.

Fine Tune Your Methods for Solving Elastohydrodynamic Lubrication Problems. In most cases the equations in the book are derived from first principles. The author describes each of the asymptotic and numerical methods in detail, making it easier for readers to apply them to various problems. The problem solutions are presented in the form of simple analytical formulas, graphs and tables. Almost all the chapters include exercises that highlight key points and skills. Suitable for engineering and applied mathematics students, this is also a unique resource for researchers and practitioners who want to fine tune their solution methods and design better numerical methods to tackle elastohydrodynamic lubrication problems.
