Pointing At The Direction Of Sound:

Anthropometric Individualization of Head-Related Transfer Functions Analysis and Modeling Ramona Bomhardt, 2017-09-04 Human sound localization helps to pay attention to spatially separated speakers using interaural level and time differences as well as angle dependent monaural spectral cues In a monophonic teleconference for instance it is much more difficult to distinguish between different speakers due to missing binaural cues Spatial positioning of the speakers by means of binaural reproduction methods using head related transfer functions HRTFs enhances speech comprehension These HRTFs are influenced by the torso head and ear geometry as they describe the propagation path of the sound from a source to the ear canal entrance Through this geometry dependency the HRTF is directional and subject dependent To enable a sufficient reproduction individual HRTFs should be used However it is tremendously difficult to measure these HRTFs For this reason this thesis proposes approaches to adapt the HRTFs applying individual anthropometric dimensions of a user Since localization at low frequencies is mainly influenced by the interaural time difference two models to adapt this difference are developed and compared with existing models Furthermore two approaches to adapt the spectral cues at higher frequencies are studied improved and compared Although the localization performance with individualized HRTFs is slightly worse than with individual HRTFs it is nevertheless still better than with non individual HRTFs taking into account the measurement effort
