<u>Points on Quantum Projectivizations</u> , **Points on Quantum Projectivizations** Adam Nyman,2003-12-17 The use of geometric invariants has recently played an important role in the solution of classification problems in non commutative ring theory We construct geometric invariants of non commutative projectivizataions a significant class of examples in non commutative algebraic geometry More precisely if S is an affine noetherian scheme X is a separated noetherian S scheme mathcal E is a coherent mathcal O _ X bimodule and mathcal I subset T mathcal E is a graded ideal then we develop a compatibility theory on adjoint squares in order to construct the functor Gamma_ n of flat families of truncated T mathcal E mathcal I point modules of length n 1 For n geq 1 we represent Gamma_ n as a closed subscheme of mathbb P _ X 2 mathcal E otimes n The representing scheme is defined in terms of both mathcal I _ n and the bimodule Segre embedding which we construct Truncating a truncated family of point modules of length i 1 by taking its first i components defines a morphism Gamma_ i rightarrow Gamma_ i 1 which makes the set Gamma_ n an inverse system In order for the point modules of T mathcal E mathcal I to be parameterizable by a scheme this system must be eventually constant In 20 we give sufficient conditions for this system to be constant and show that these conditions are satisfied when mathsf Proj T mathcal E mathcal I is a quantum ruled surface In this case we show the point modules over T mathcal E mathcal I are parameterized by the closed points of mathbb P _ X 2 mathcal E   <u>The Geometry of Points on Quantum Projectivizations</u> Adam Nyman,2001
