Basic and Clinical Concepts of Lung Cancer Heine H. Hansen,2012-12-06 The last volume dealing with lung cancer in this series in *Cancer Treatment and Research* was published in 1986 and entitled *Lung Cancer Basic and Clinical Aspects* The present book continues the outline of the previous volume by presenting up to date information on lung cancer in critical reviews of new important basic and clinical concepts of lung cancer The present volume has broadened the scope by also including chapters dealing with issues such as epidemiology prophylaxis and histopathology of lung cancer The content of the book thus reflects the increasing awareness of a global disease that is more and more in focus not only scientifically but also

politically The latter fact results increasingly in changes in health legislation with prevention measures influencing everyday life The great interest in the disease is natural considering that more than one patient dies from lung cancer every minute globally The first chapter is from the Cancer Unit WHO Geneva and describes in detail the epidemiologic features of lung cancer which is the second most frequent cancer in the world with 660 500 new cases annually it will soon surpass stomach cancer as the leader Thirty one percent of the cases occur in developing countries where the increase is especially dramatic

Molecular and Clinical Advances in Anticancer Drug Resistance Robert F. Ozols, 2012-12-06 The importance of drug resistance in cancer chemotherapy cannot be overstated The 500 000 patients who die every year from cancer in the United States have in most cases been treated with chemotherapy Many of these patients responded initially to chemotherapy but death resulted from the development of drug resistant tumors In the first volume in the series Drug Resistance in Chemotherapy the results of comprehensive laboratory studies aimed at understanding the mechanisms for resistance to individual agents and to the development of broad cross resistance were described In the past 2 years there has been substantial progress in understanding the molecular biology associated with these mechanisms of drug resistance For the first time we are starting to understand which mechanisms are playing an important role in human tumors and even more importantly clinical trials have recently been initiated in an effort to reverse specific forms of drug resistance The purpose of this volume is to describe the new advances both at the molecular level and in the clinic regarding mechanisms of drug resistance and potential ways this resistance can be circumvented This volume is focused upon mechanisms of resistance associated with two major classes of anticancer drugs alkylating agents including cisplatin and the natural

products e g adriamycin and vinblastine The first section of the book describes new insights into the genetic mechanisms associated with drug resistance

Treatment of Soft Tissue Sarcomas H.M. Pinedo, J. Verweij, 2012-12-06 One of the major advances of the last decade concerning the treatment of patients with soft tissue sarcomas is that an increased number of patients are being discussed in multidisciplinary teams prior to the initial treatment The present volume on soft tissue sarcomas in the series Cancer Treatment and Research reflects the multidisciplinary approach with a focus on recent developments The availability of new histopathologic techniques has reduced the number of unclassified sarcomas and has further increased the importance of the histopathologist in providing estimates of the prognosis of the patient as well as data for the planning of treatment strategy Further data for this strategy will be provided by diagnostic imaging In this field the role of magnetic resonance imaging has been further defined Of utmost importance is the recent trend toward consensus in staging The modification of the staging

system of the American Joint Commission for Cancer Staging and End Results Reporting brings the possibility of a single staging system within reach in the next decade. As surgery still provides the only chance for cure, the importance of being the most sparing as possible is obvious. For this reason, radiotherapy has been applied with success. The introduction of relatively new radiation techniques is therefore being observed with interest.

,1993 **Prostate Cancer - Clinical And Scientific Aspects: Bridging The Gap** Paul David Abel, El-nasir

Lalani, 2003-12-01 Despite the advent of the genomic era, the perceived benefits of close collaboration between clinicians and scientists are not always realised and the gap between bench and bedside remains. Closer collaboration should expedite advances in treating disease. This important book, with a foreword by Fritz H Schröder, is designed to enhance the relationship between the two communities. It contains data from a multinational authorship, the thirty-eight chapters being written by experts with widely differing training and expectations. Their aim is to facilitate both understanding and in-depth knowledge of their subject. By bridging the gap between clinicians and scientists, the hope is to enhance translational research in their common goal of improving the diagnosis and treatment of prostate cancer, the single most important cancer affecting men.

Oncogenes and Tumor Suppressor Genes in Human Malignancies Christopher Benz, E.T. Liu, 2012-12-06 The first edition of *Oncogenes* 1989 focused on several of the better known transforming mechanisms and surveyed a spectrum of solid tumors and hematologic malignancies. Several of the nearly 50 known oncogenes most relevant to human disease were examined. In contrast, this volume presents a very different profile and balance of subject material that reflects the rapidly changing field of molecular oncology and its newly emerging concepts. Among the most important discoveries of the past 4 years are the identification of nearly a dozen different tumor suppressor genes and the finding of an entirely new class of cancer-causing gene, *bcl-2*, that acts by inhibiting cell death rather than stimulating cell proliferation. This edition begins by reviewing selected malignancies in which our earlier search for clinically relevant oncogenes has led to more focused studies on gain of function and loss of function genetic abnormalities as well as autocrine and paracrine growth factor loops known to regulate tumor physiology and malignant cell behavior. Curiously, many of these genetic and functional abnormalities are shared by several different tumor types and are not uniformly present in all tumors of the same type. This observation brings up molecular questions about the tissue-specific determinants that underlie individual cancers and also gives added impetus to the suggestion that molecular abnormalities referred to as tumor markers be included among the histopathologic features used for clinical diagnosis and management.
