Marine Annelids Of North Carolina:

The Marine Annelids of North Carolina Olga Hartman, 1945 *The North Carolina Coastal Zone and Its Environment*, 1977 Annelida Greg Rouse, Fredrik Pleijel, Ekin Tilic, 2022-01-14 Annelids the segmented worms exist in a remarkably diverse range of mostly marine but also freshwater and terrestrial habitats varying greatly in size and form Annelida provides a fully updated and expanded taxonomic reference work which broadens the scope of the classic Polychaetes OUP 2001 to encompass wider groups including Clitellata comprising more than a third of total annelid diversity Sipuncula and Thalassematidae formerly Echiura It reflects the enormous amount of research on these organisms that has burgeoned since the millennium principally due to their use as model organisms to address wider and more general evolutionary and ecological questions Beginning with a clear introduction to the phylum and an outline of annelid taxonomy this authoritative text describes their collection the methods to ensure their optimal preservation and an overview of anatomy with its relevant terminology The core of the work comprises 77 fully up to date taxonomic chapters informed by anatomy and the latest molecular phylogenomic evidence and carefully organised based on a new robust phylogenetic hypothesis Lavishly illustrated throughout with hundreds of previously unpublished high resolution colour images and SEM micrographs the sheer beauty and diversity of the annelids is nowhere better presented Annelida is the definitive reference work for annelid biologists whilst being of interest to a broader audience of invertebrate zoologists systematists and organismal biologists Annelida Basal Groups and Pleistoannelida, Sedentaria I Günter Purschke, Markus Böggemann, Andreas Schmidt-Rhaesa, Wilfried Westheide, 2019-03-18 This book is the first in a series of 4 volumes in the Handbook of Zoology series about morphology anatomy reproduction development ecology phylogeny and systematics of Annelida This first volume covers members of the so called basal radiation and the first part of Sedentaria It is supplemented by chapters on the history of annelid research their fossil record and an introduction to the phylogeny of annelids and their position in the tree of life In the latter chapter the history of their systematic is reviewed giving an almost complete picture of systematic scientific progress especially in the past years which changed our view on annelid phylogeny dramatically The most basal annelids lately united as Palaeoannelida represent two families of aberrant polychaetes formerly often suggested to be highly derived which now give us a fresh look on how the ancestral annelid may have looked like These lack certain key characters such as nuchal organs and possess rather simple nervous systems which now likely represent primitive character states In this basal radiation the first taxon of apparently unsegmented and achaetigerous animals is positioned the Sipuncula Most likely another group of platyhelminth like and unsegmented and even chaeta less annelids Lobatocerebridae falls into this basal radiation The section of Sedentaria starts with Orbiniida a taxon characterized by elongated thread like worms which do not have anterior appendages like palps and comprises several families representing members of the Meiofauna These minute worms often inhabiting the interstitial spaces in marine sands are suggested to have evolved by progenesis The second

higher taxon is represented by Cirratuliformia comprising nine families of typical sedentary polychaetes each of which showing a remarkable variation of the annelid body plan. Members of this taxon usually exhibit many annelid characters but certain also lack the most typical prostomial appendages the palps. *Bulletin United States National Museum*, 1963

Pleistoannelida, Sedentaria II Günter Purschke, Markus Böggemann, Andreas Schmidt-Rhaesa, Wilfried Westheide, 2020-02-24 This book is the second volume in a series of 4 volumes in the Handbook of Zoology series treating morphology anatomy reproduction development ecology phylogeny systematics and taxonomy of polychaetous Annelida. In this volume a comprehensive review of a few more derived higher taxa within Sedentaria are given namely Sabellida Opheliida Capitellida as well as Hrabieillidae. The former comprise annelids possessing a body divided into two more or less distinct regions or tagmata called thorax and abdomen. Here two groups of families are united the spioniform and sabelliform polychaetes. Especially Spionidae and Sabellidae are speciose families within this group and represent two of the largest annelid families. These animals live in various types of burrows or tubes and all possess so called feeding palps. In one group these appendages are differentiated as grooved feeding palps whereas in the other they may form highly elaborated circular tentacular crowns comprising a number of radioles mostly giving off numerous filamentous pinnulae. Often additionally colourful the latter are also received the common names feather duster worms flowers of the sea Christmas tree worms Opheliida Capitellida including five families of truly worm like annelids without appendages represents the contrary. Their members burrow in soft bottom substrates and may be classified as non selective deposit feeders. Molecular phylogenetic analyses have shown that Echiura or spoon worms formerly regarded to represent a separate phylum are members of this group. Last not least Hrabieillidae is one out of only two families of oligochaete like terrestrial polychaetes and for this reason received strong scientific interest. **Circular**, 1972 *Systematics, Biology and Morphology of World Polychaeta* Mary E. Petersen, J.B. Kirkegaard, 2023-07-03 Contains 67 original papers by nearly 100 of the world's leading specialists. Together with abstracts and literature references for 37 presentations not represented by papers this volume provides complete coverage of the Conference and a comprehensive overview of modern research on the polychaete annelids one of the most important groups of marine invertebrates and constituents of marine benthos. Taxonomic and subject indices of all papers and abstracts provide ready access to the contained information. Richly illustrated this book is provided with numerous line drawings and photomicrographs electron micrographs. Over 60 taxa are newly described or reassigned and detailed reviews revisions or redescrptions are provided for five families one subfamily and numerous genera and species.

with many illustrations of new and redescribed taxa and a pictorial key to the magelonids of Thailand **Proceedings of the Biological Society of Washington** Biological Society of Washington,1914 Systematics and Diversity of Annelids Maria Capa,Pat Hutchings,2021-08-18 In this Special Issue we address the state of the art of the systematics of the main annelid groups and the improvements in the diversity they hold with special emphasis on the latest discoveries in well studied areas expeditions to unsurveyed areas or environments or the use of novel techniques that allow for the improvement of biodiversity knowledge We are hoping that this Special Issue will provide a platform facilitating a review of current knowledge on the subject identifying current research problems as well as indicating directions and research trends for the future Bibliography of Polychaeta: Volume 2 Charlene D. Long,1975 **Special Scientific Report** ,1965 *Journal of the Elisha Mitchell Scientific Society* Elisha Mitchell Scientific Society (Chapel Hill, N.C.),1975 Vol 20 include the Proceedings of the North Carolina Academy of Science 1902 Pleistoannelida, Errantia II Günter Purschke,Markus Böggemann,Wilfried Westheide,2022-01-19 This book is the fourth in a series of 4 volumes in the Handbook of Zoology series about morphology anatomy reproduction development ecology phylogeny and systematics of Annelida It covers the most typical polychaetes Phyllodocida together with certain smaller taxa placed incertae sedis This volume completes the polychaetous Annelida Phyllodocida are often vagile possess well developed parapodia Due to their broad and flat cirri these parapodia look like leaves in some taxa and leading to the name of the entire group Many of its members are macrophagous and often predators Accordingly most species possess elaborate sense structures such as sensory palps antennae eyes and nuchal organs In certain species the eyes comprise thousands of photoreceptor cells and lenses most likely allowing forming true images Phyllodocida typically possess an axial muscular pharynx called proboscis functioning as a kind of suction pipe allowing them to swallow and ingest their prey or other food This pharynx may be armed with cuticular jaws and some species even possess venom glands The probably most popular and important polychaete model organism *Platynereis dumerilii* belongs to this interesting group Phyllodocida fall into two to three higher clades comprising about 25 families which represent more than one fourth of the polychaete diversity One of these families Syllidae comprises about 700 valid species of mainly small size and may therefore represent one of the most complex and somehow difficult polychaete families on Earth **Fishery Bulletin of the** ,1954
