Renovascular hypertension can result from renal artery lesions involving the main renal artery, or its branches. It is generally felt that the elevation of blood pressure results from excessive systemic vasoconstriction secondary to enhanced renin secretion by one or part of one kidney. Renin secretion is enhanced because of constriction of the renal artery and resultant intrarenal ischemia. Clinically patients cannot be distinguished from those with essential hypertension and diagnosis must be made with arteriography although urography and isotope renography may suggest the diagnosis. Surgical cure can be predicted if differential renal vein renin ratios lateralize but a non-lateralizing study does not necessarily mean that surgery will fail. In properly selected patients, surgical results are excellent.

Renovascular hypertension is most commonly recognized in patients with stenosis of a main renal artery, but stenosis or obstruction of renal artery branches, extrinsic masses which compress the kidney, and renal parenchymal lesions that result in ischemia can also cause renovascular hypertension. One or both kidneys may be involved. Since renal artery stenosis may be present in patients without hypertension and since repair of a stenotic renal artery does not always cure hypertension, surgical cure is the only definite criterion for establishing a causal relationship between an anatomic renal abnormality and hypertension [1].

The first surgical cure of hypertension was reported in 1937 [2], shortly after Goldblatt and co-workers demonstrated that dogs could be made hypertensive by constricting one renal artery and removing the contralateral kidney [3]. The concept of surgical therapy for hypertension was appealing, since effective antihypertensive drug therapy was not available. However, a summary in 1956 of results of approximately 2,000 nephrectomy operations in hypertensive patients revealed that only 20 percent were normotensive one year after operation [4]. Since then, much investigative effort has been directed at improving diagnostic procedures to distinguish patients with surgically curable hypertension from those in whom surgery would be futile. During these two decades safe, inexpensive, and effective drug regimens have developed as well, offering an alternative to surgery and making it more important to carefully select patients for operation.

Renovascular Hypertension Nicola Glorioso, John H. Laragh, Alessandro Rappelli, 1987 Kidney Disease and Nephrology Index ,1979 **Renovascular and Renal Parenchymatous Hypertension** Thomas Luescher, Norman M.

Kaplan, 2012-12-06 This monograph provides a timely update on the pathophysiology diagnosis and therapy of renovascular and renal parenchymatous hypertension The underlying causes of the most common forms of hypertension are discussed in separate chapters Special emphasis is laid on newer pathophysiological aspects of the disease in particular the vascular wall renin angiotensin system Furthermore there is in depth discussion of all the new techniques that are currently available for use in the diagnosis of renal hypertension e g ultrasound and Doppler techniques magnetic resonance imaging and nuclear renography These techniques are discussed by internationally renowned experts in the field The book also covers topics such as the value of medical therapy surgical techniques and percutaneous transluminal angioplasty with special reference to the treatment of renal hypertension *Laragh's Lessons in Renin System Pathophysiology for Treating Hypertension and Its*

Fatal Cardiovascular Consequences John H. Laragh, 2002 Here s an essential reference for anyone needing an advanced understanding of the nature and treatment of hypertension Dr Laragh a pioneering clinician and scientist demonstrates the central role of an overactive renin system for causing most hypertension In his new book Dr Laragh discusses his research and its relevance to caring for everything from asymptomatic patients to hypertensive emergencies And he provides visit by visit details of his new pathophysiologically and biochemically guided treatment The result of his work is a specific approach that makes it possible to more effectively prevent arrest and treat hypertension and its consequences including congestive heart failure myocardial infarction kidney failure and stroke **Clinical Nephrology: Immunologic Considerations,**

Invasive Techniques and Dialytic Strategies G. D'Amico, G. Colasanti, 1989-04-04 **Essential Hypertension and Its Causes** Paul I. Korner, 2007-05-11 This new account of the pathogenesis of essential hypertension EH represents a detailed analysis of the main components of the circulatory control system The latter s properties resemble those of man made adaptive control systems in which regulatory parameters are altered when operating conditions exceed certain limits often through neural mechanisms Inheritance of EH depends on both genes and environment The high blood pressure BP genes have not yet been definitively identified whilst the main environmental causes are mental stress high dietary salt intake and obesity EH occurs as two major syndromes each initiated by chronic stress 1 Stress and salt related EH and 2 Hypertensive obesity Stress is perceived by the cortex from which increased dopaminergic DA neuron activity stimulates the hypothalamic defense area raising sympathetic neural activity SNA and BP Normally these subside quickly when the stress is over but in those susceptible to EH the DA synapses become sensitized so that the defense response is evoked by ever lower levels of stress Sensitization is common in memory circuits but not in autonomic neurons so that this property in EH may be genetically determined Stress related hypertension increases hypothalamic responsiveness to high salt resulting in further

risers in SNA and BP Later non neural functional changes e g reduction in nitric oxide and the structural remodeling of resistance vessels further enhance the vasoconstriction In contrast in those developing hypertensive obesity food consumption is excessive which transiently alleviates stress related anxiety The brain ignores the leptin mediated signals that normally curb appetite contrasting with normal energy regulation in SSR EH In hypertensive obesity the SNA pattern is similar to that in SSR EH but vasoconstriction is masked by vasodilatation and fluid retention due to hyperinsulinemia This syndrome is a volume overload hypertension where high cardiac output renal impairment and other non neural factors contribute to the elevation of BP Other topics include the role of various transmitters in autonomic regulation the place of baroreflexes in the intact organism why exercise training lowers resting BP obstructive sleep apnea non pharmacological and drug treatment of EH the role of the kidney in EH and in different types of renal hypertension and the pathogenesis of the Japanese spontaneously hypertensive rat which provides a valuable animal model for EH The work suggests that
