Transuranic System Assessment ,2001 This document identifies the necessary actions for addressing current questions

concerning the safe and efficient disposal of remote handled transuranic wastes that have been generated through

Department of Energy activities In addition this document presents summaries of existing information and analyses

regarding the potential alternatives for disposing of remote handled RH transuranic TRU waste at the Department of Energy

DOE Waste Isolation Pilot Plant WIPP A further discussion of DOE s approach for addressing RH TRU issues is contained in

the document Waste Isolation Pilot Plant Remote Handled Transuranic Waste Disposal Strategy DOE WIPP 95 1090 DOE

1995a Of this stored and projected inventory approximately 30% can be characterized with current technology and

subsequently certified to meet the waste acceptance criteria for disposal at WIPP characterization of the remaining 70% will

require the use of alternative techniques At most of the generator sites characterization equipment and facilities need to be

procured in order for the sites to certify waste for shipment either to WIPP or to an interim site If surface dose rates are too

high the use of non invasive techniques such as non destructive examination NDE and non destructive assay NDA may be

precluded Characterization methods using NDA can be effectively used on RH TRU wastes with surface dose rates of less

than 1 0 rem hr neutron NDE methods are effective on waste with surface dose rates of less than 10 rem hr gamma The

ability to use current NDE technology on waste with surface dose rates above 10 rem hr will need to be demonstrated

Alternate characterization techniques such as examination within a hot cell could be used for the remaining waste however

such techniques are labor intensive and would require additional effort to gather assay data Improvements in

characterization capabilities are being pursued through future technology development initiatives *Waste Isolation Pilot*
